

Models and past ocean de-oxygenation

Andy Ridgwell

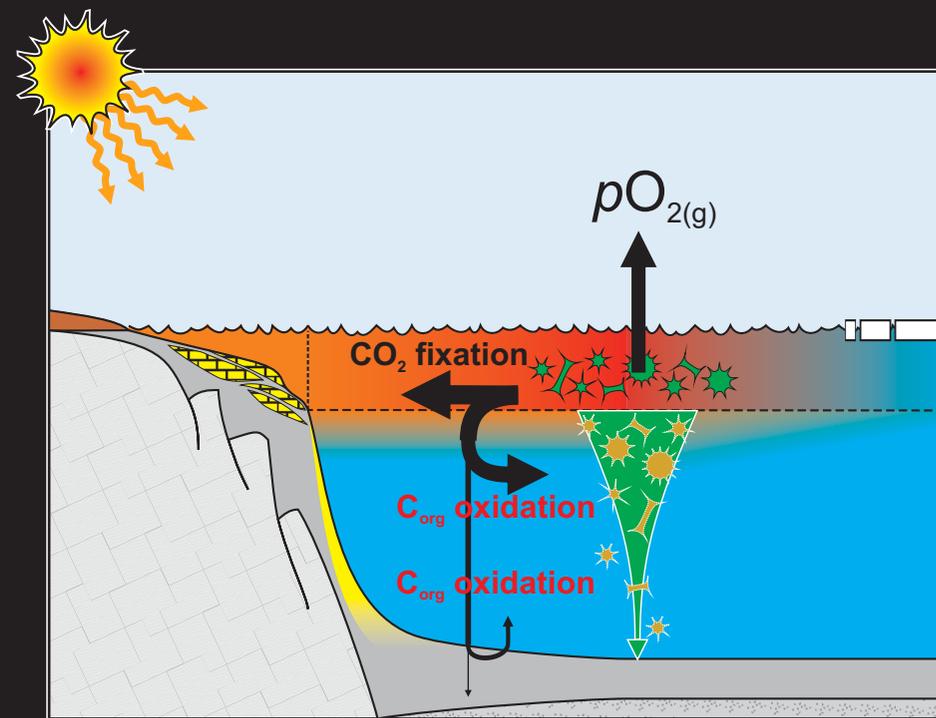

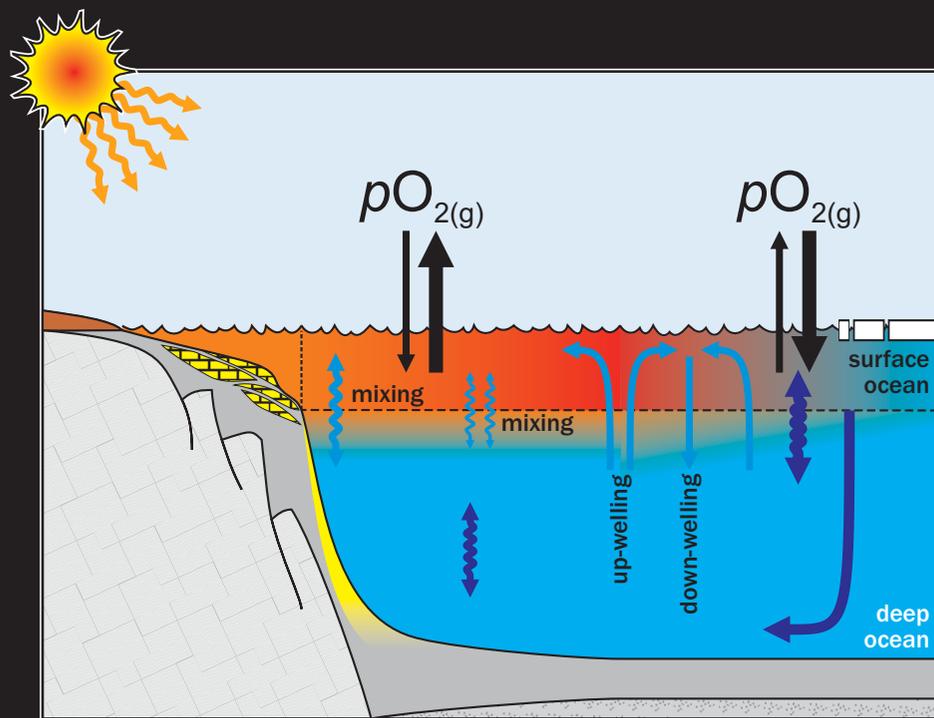

Controls on ocean oxygenation:

1. Ocean circulation and climate

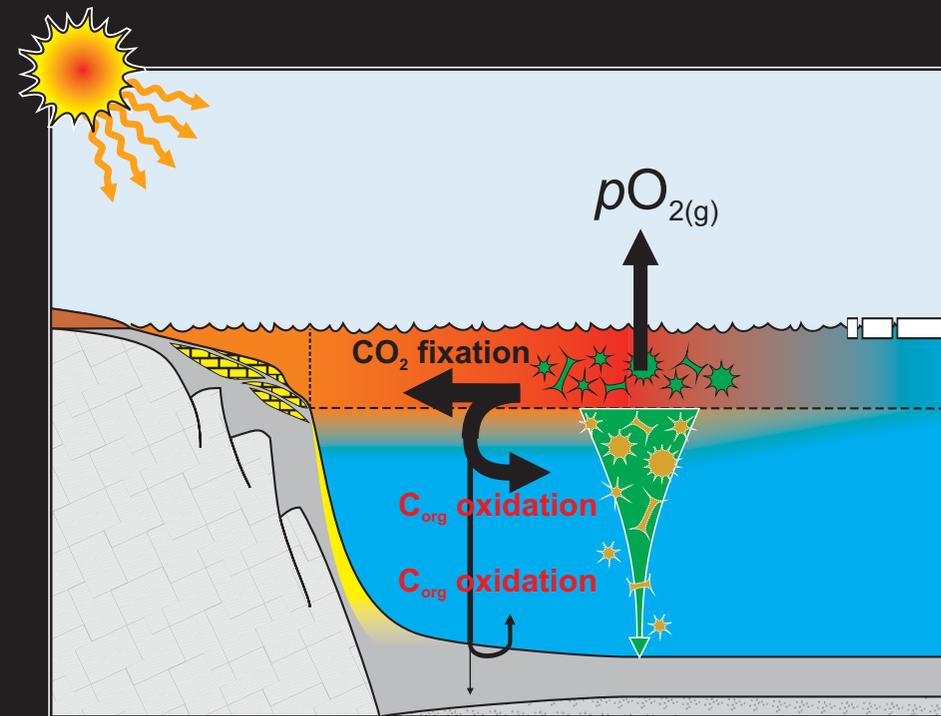

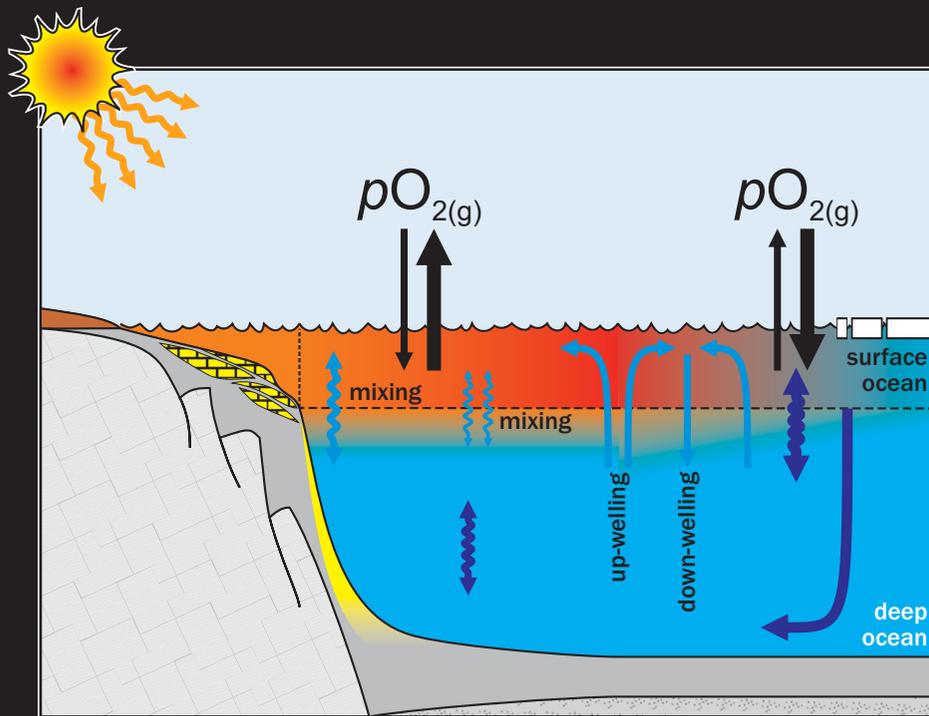

Controls on ocean oxygenation:

1. Ocean circulation and climate
2. Organic carbon degradation

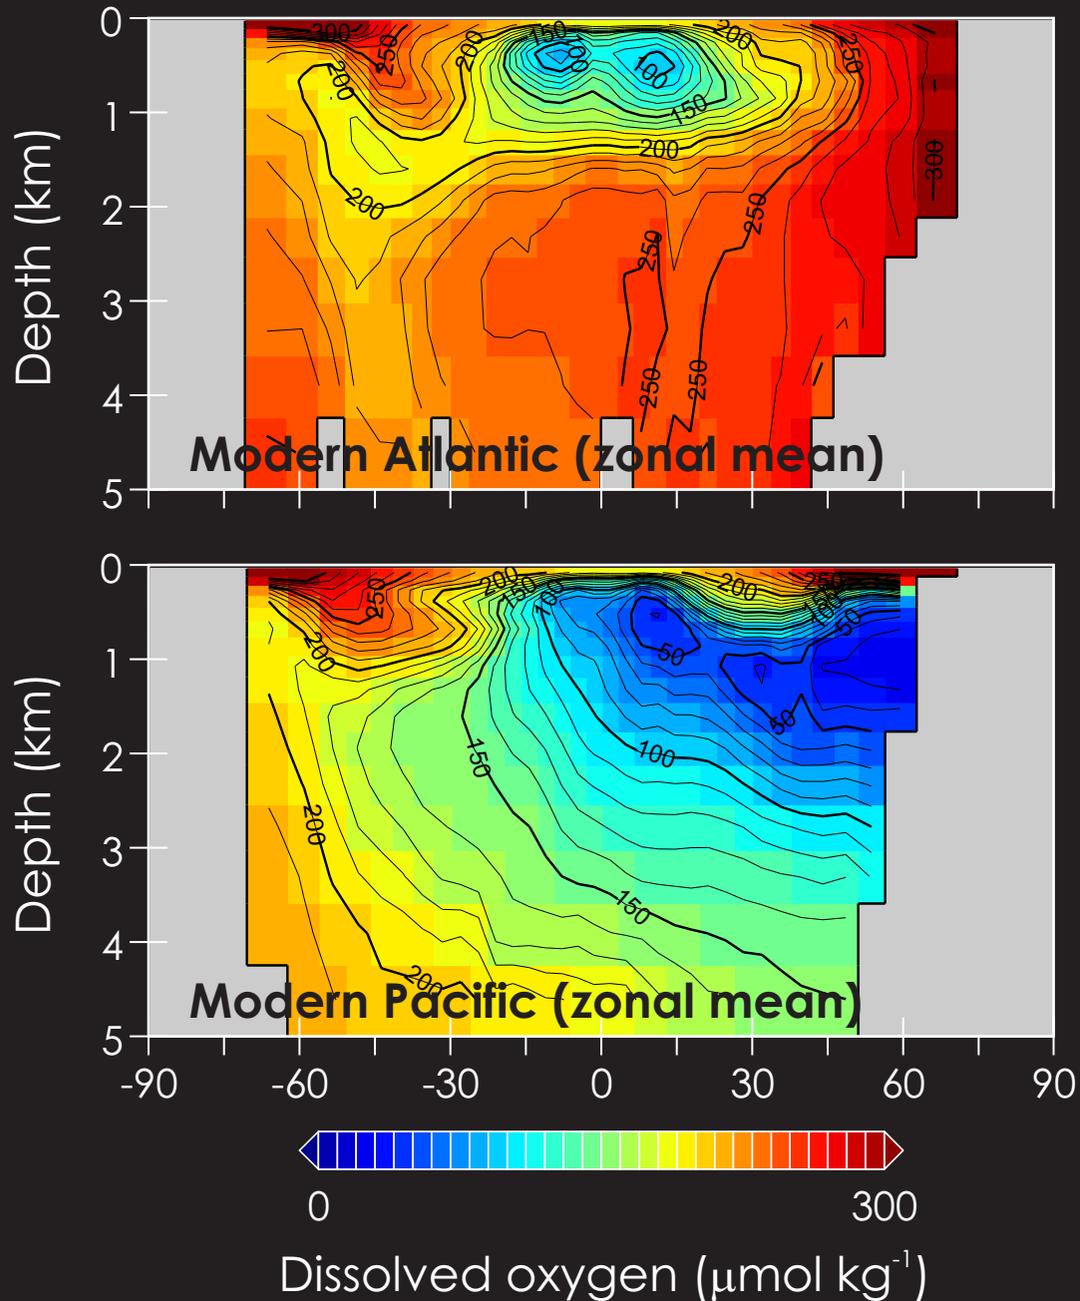

Controls on ocean oxygenation:

1. Ocean circulation and climate
2. Organic carbon degradation
3. Oxidation of reduced species

Controls on ocean oxygenation:

Modern (and general Phanerozoic?) ocean

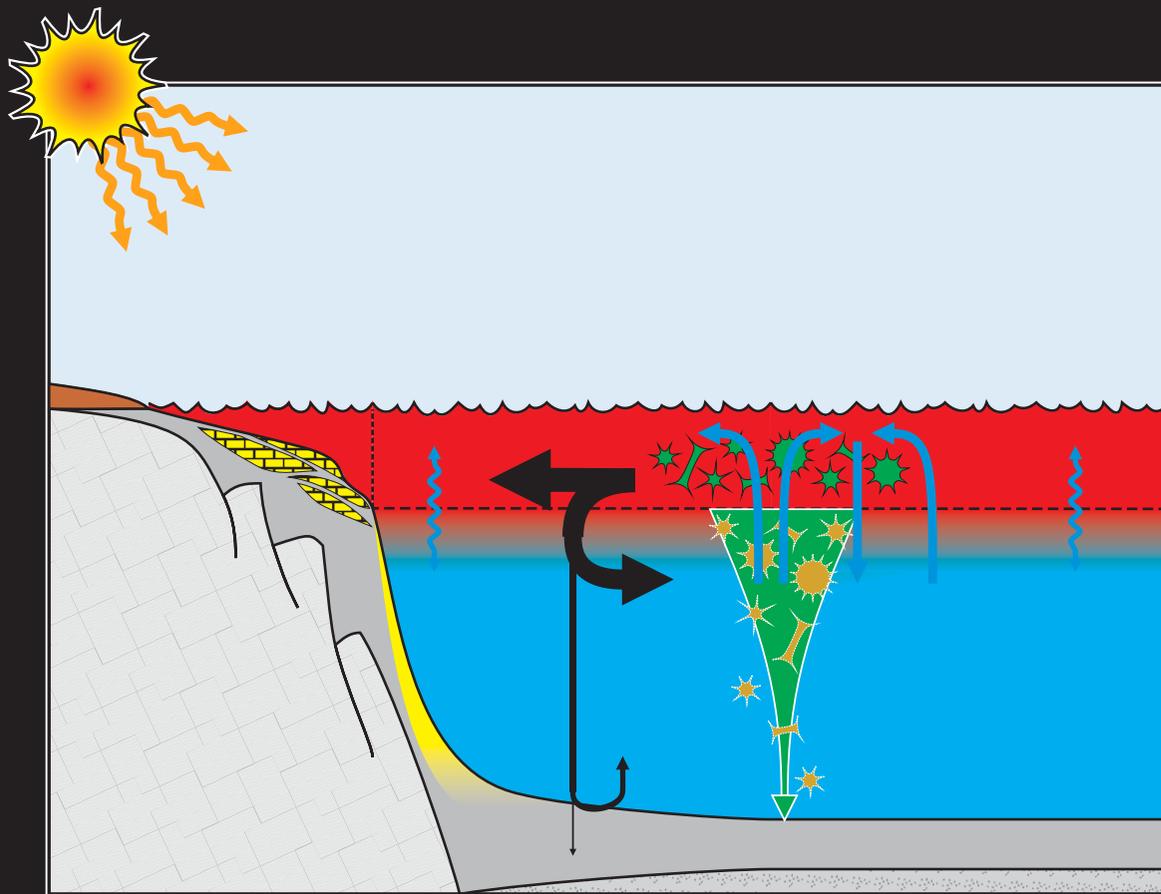

Modern observations, illustrating the combined controlling factors of ocean circulation in supplying O_2 (principally from the poles and to the abyssal ocean), and bacterial respiration of exported organic matter in consuming it (principally to intermediate depths).

Controls on ocean oxygenation revisited: Ocean circulation in a warm climate

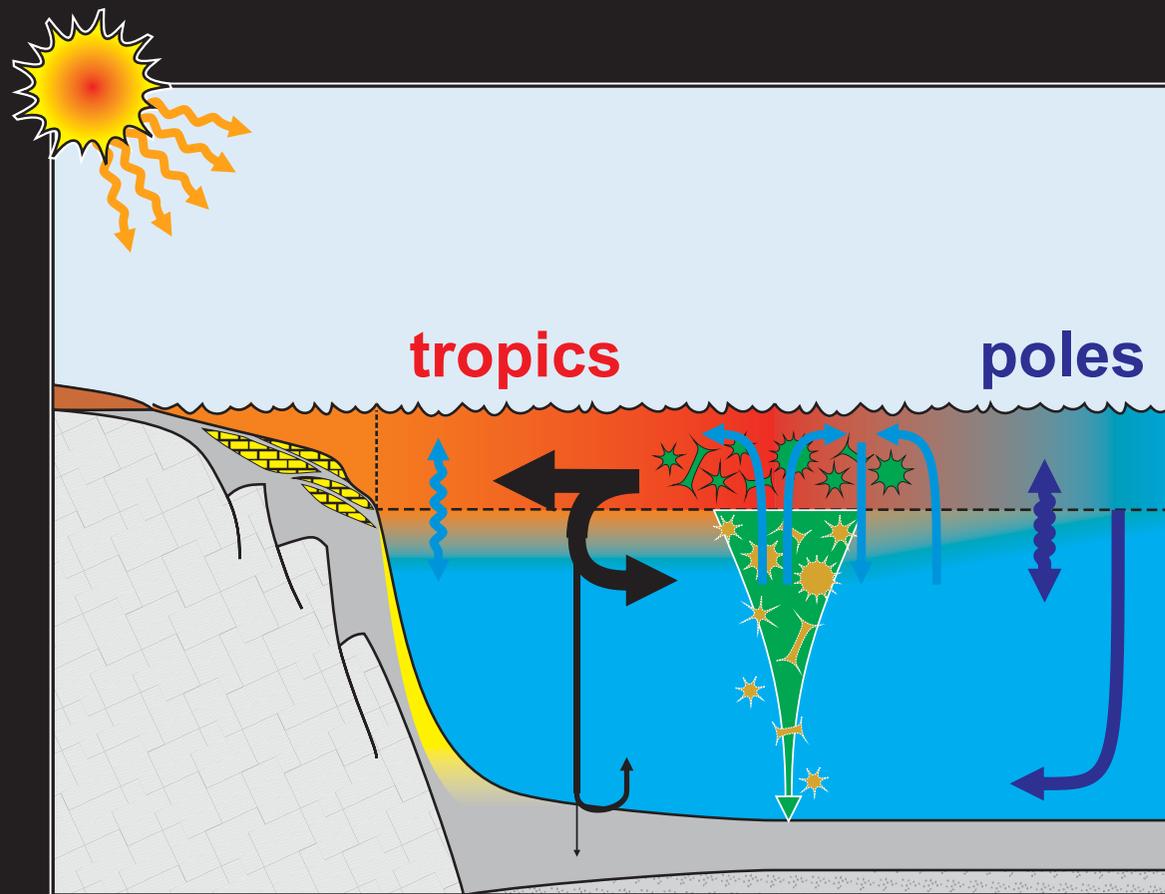

(warm == stratified) && (stratified == anoxic) == .true.

???

('stratified' || 'sluggish' || 'stagnant')

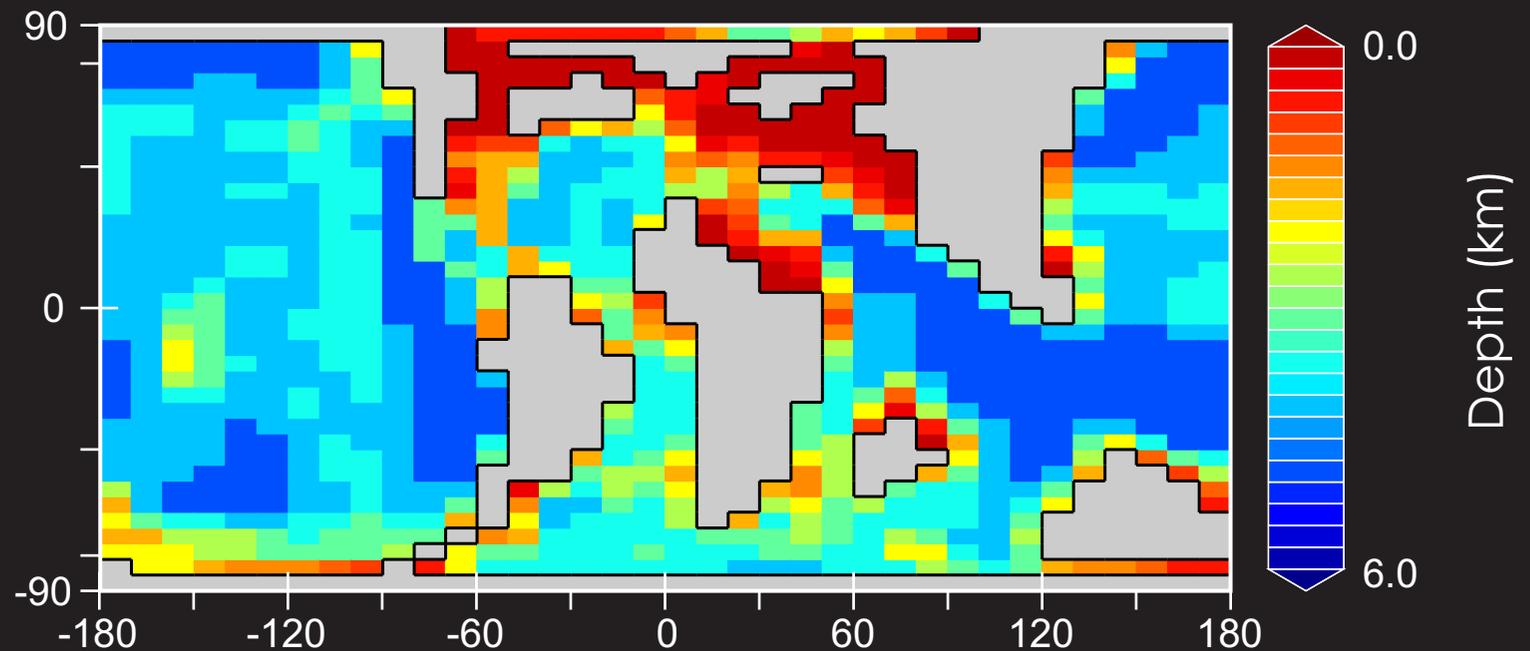

*Controls on ocean oxygenation revisited:
Ocean circulation in a warm climate*

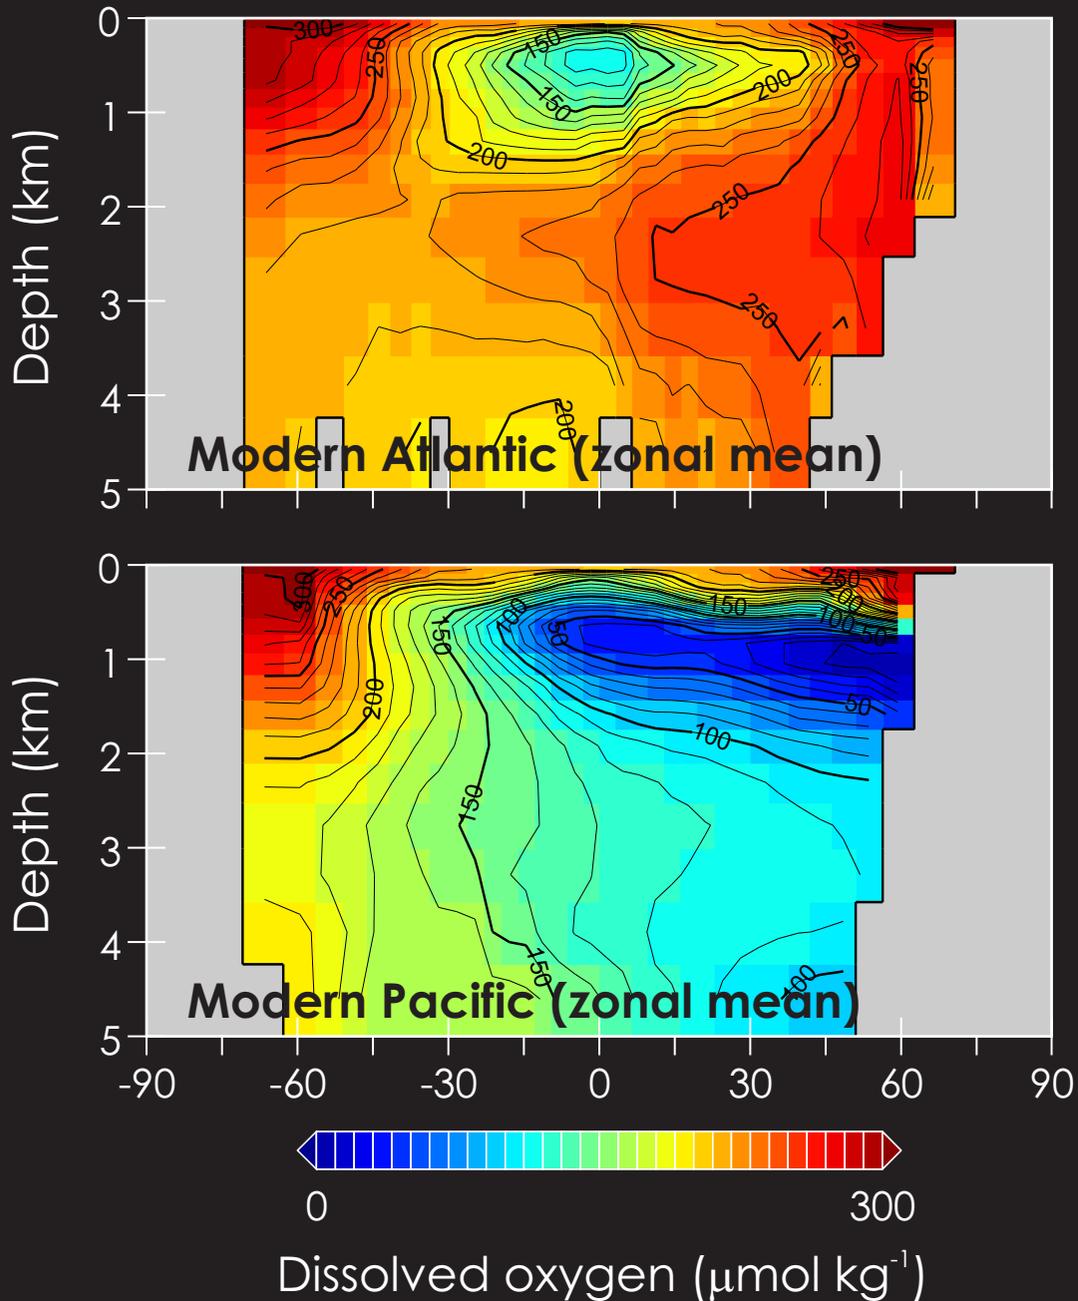

Controls on ocean oxygenation revisited: Ocean circulation in a warm climate

'cGENIE' Earth system model re-grided for the latest Maastrichtian following simulations from the HadCM3L fully-coupled GCM.

Controls on ocean oxygenation:

Modern (and general Phanerozoic?) ocean

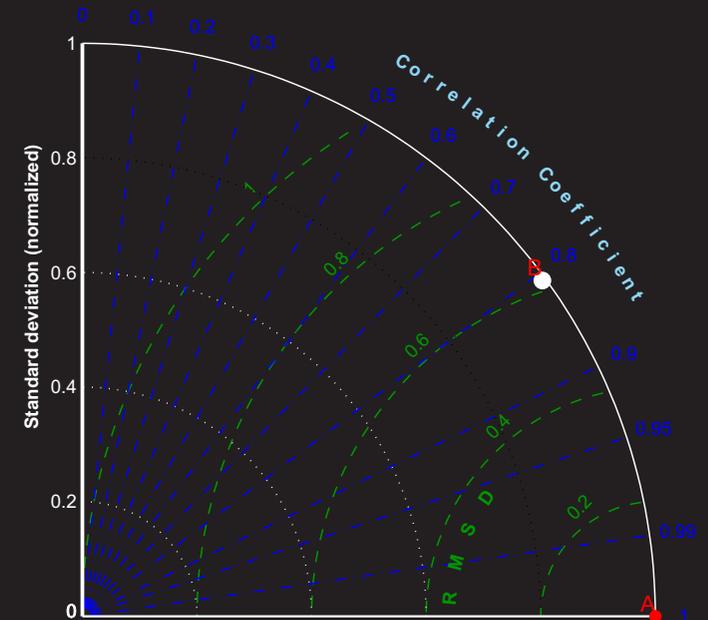

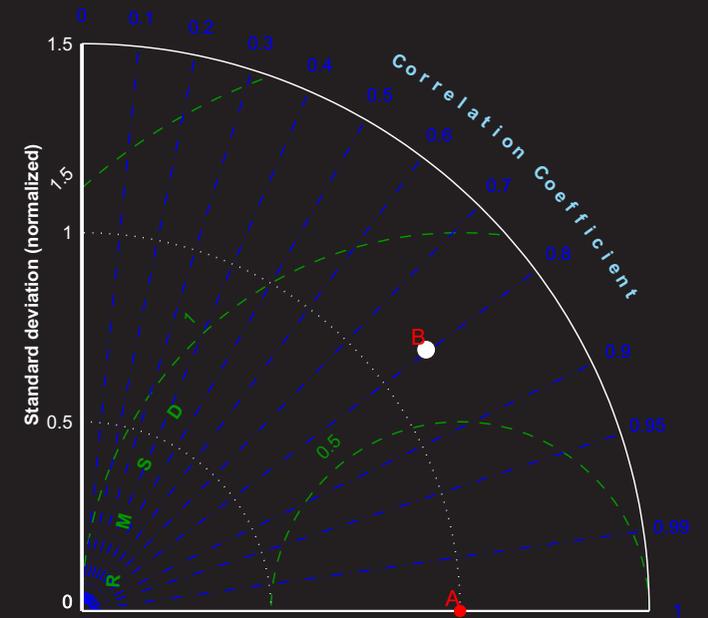

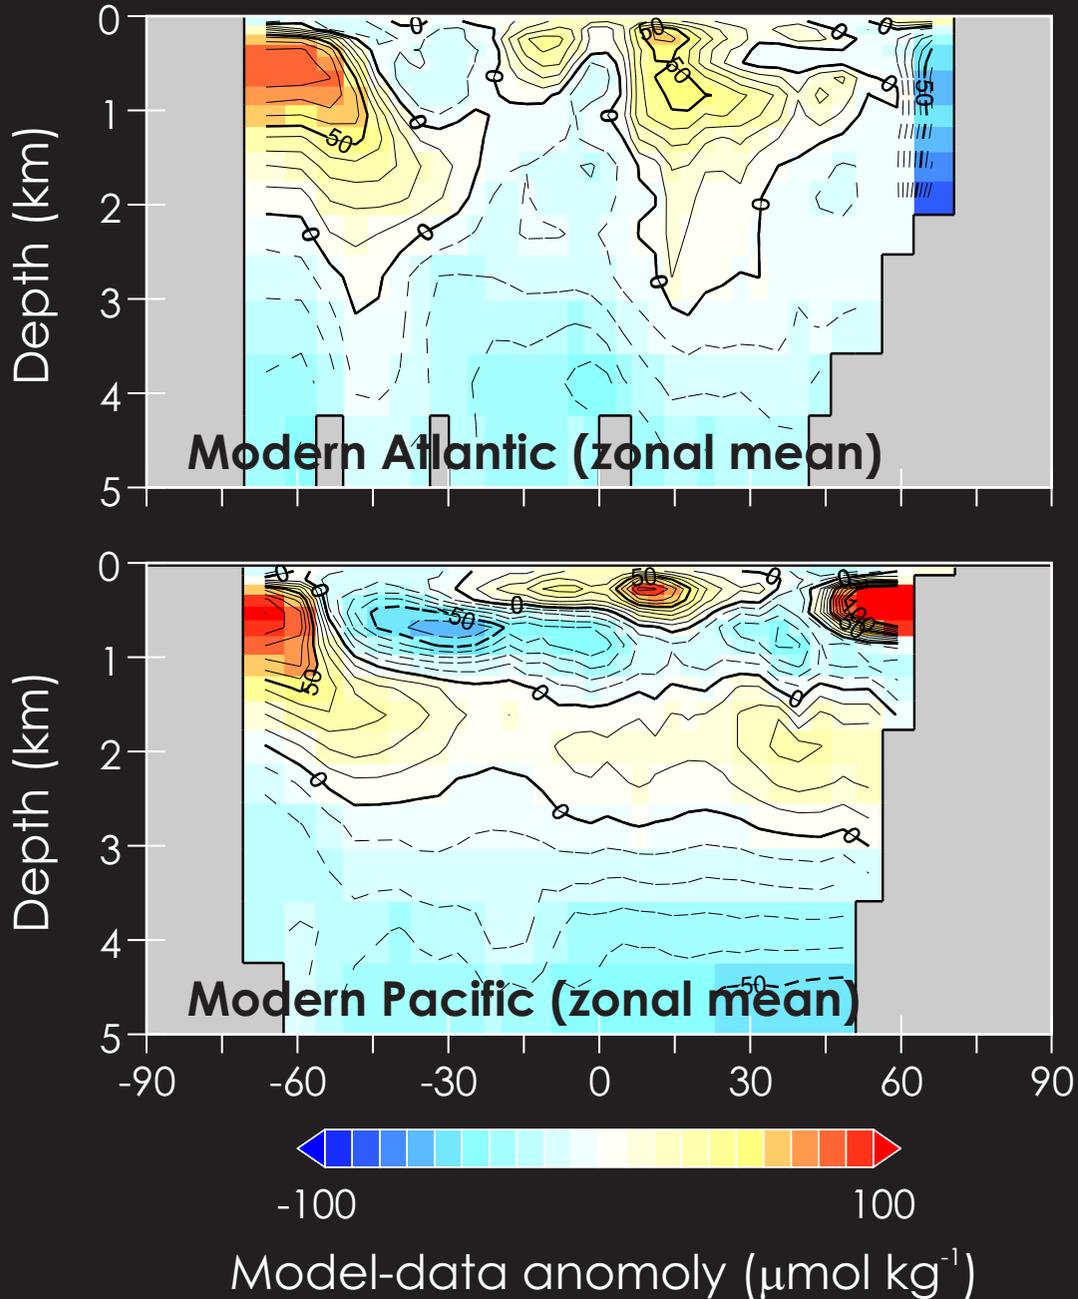

Same ocean zonal means ... now in model world.

Are the main features 'well reproduced'?

(What even are the 'main features'?)

Controls on ocean oxygenation:

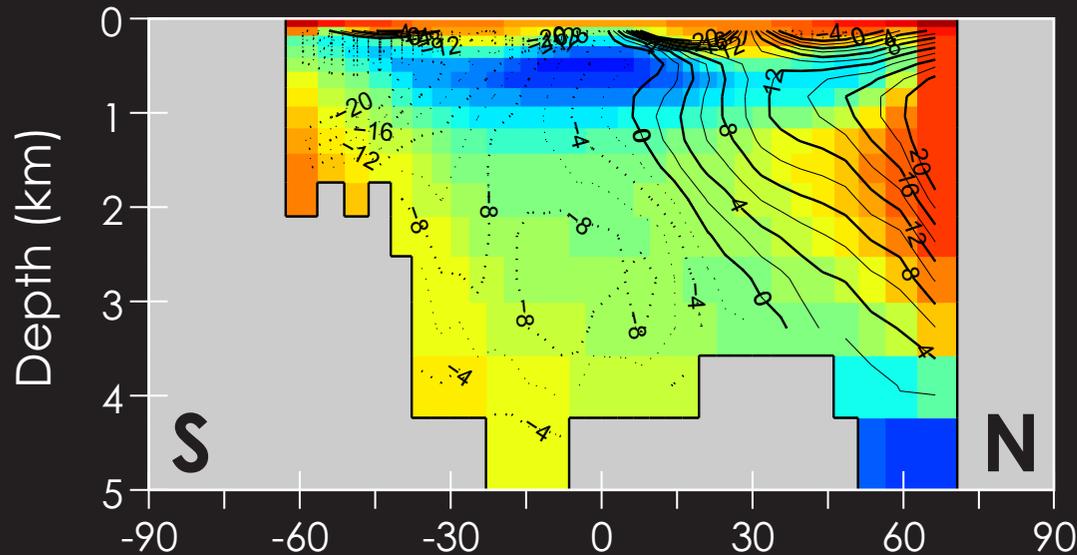

Modern (and general Phanerozoic?) ocean

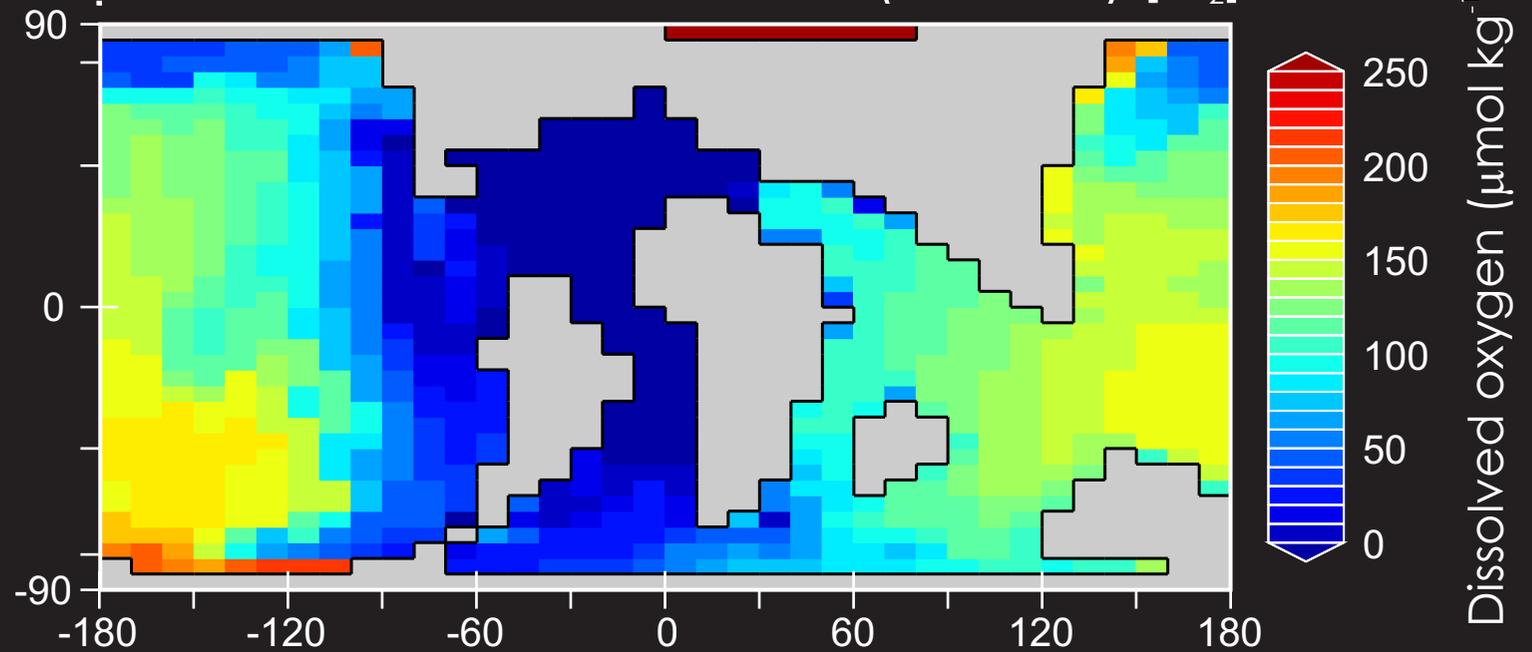

Model-data assessments can be made statistically by e.g., 'Taylor diagrams'

Controls on ocean oxygenation revisited: Ocean circulation in a warm climate

x4 CO₂ reference simulation

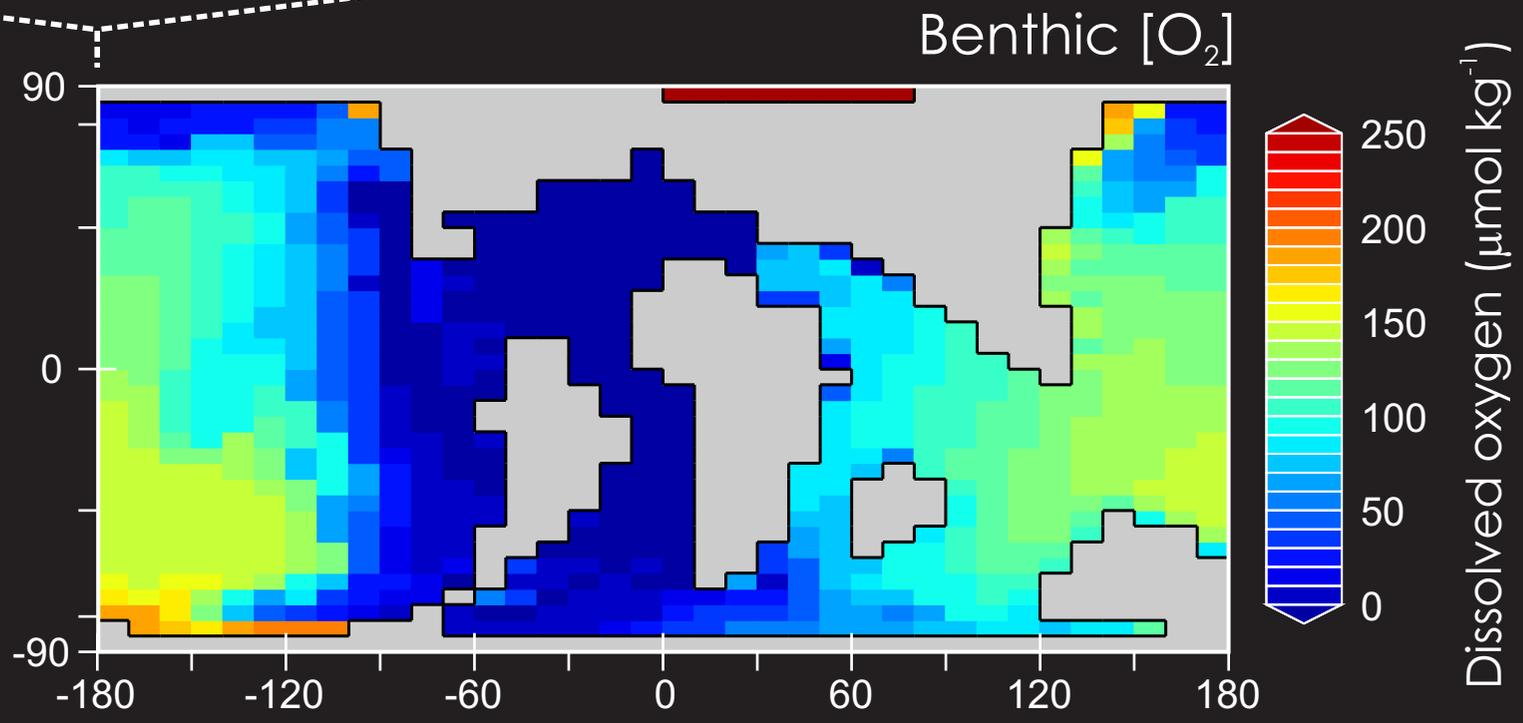

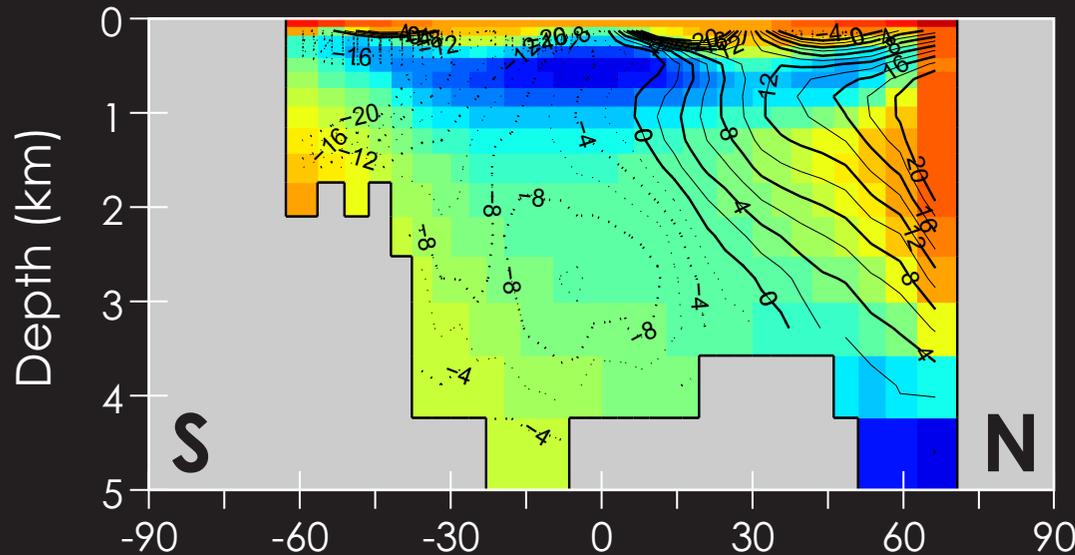

Benthic (>1000m) [O₂]

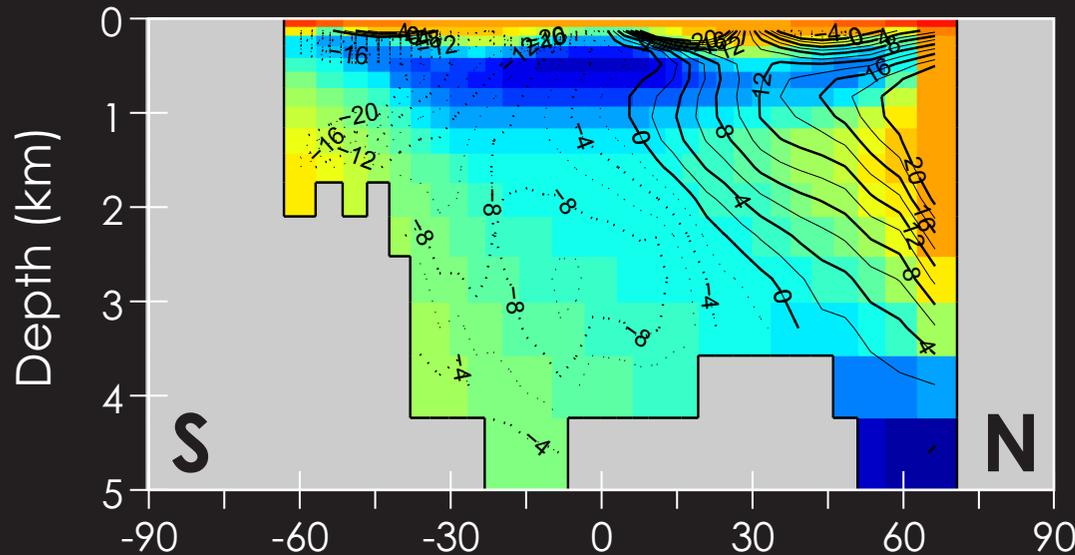

Controls on ocean oxygenation revisited: Ocean circulation in a warm climate

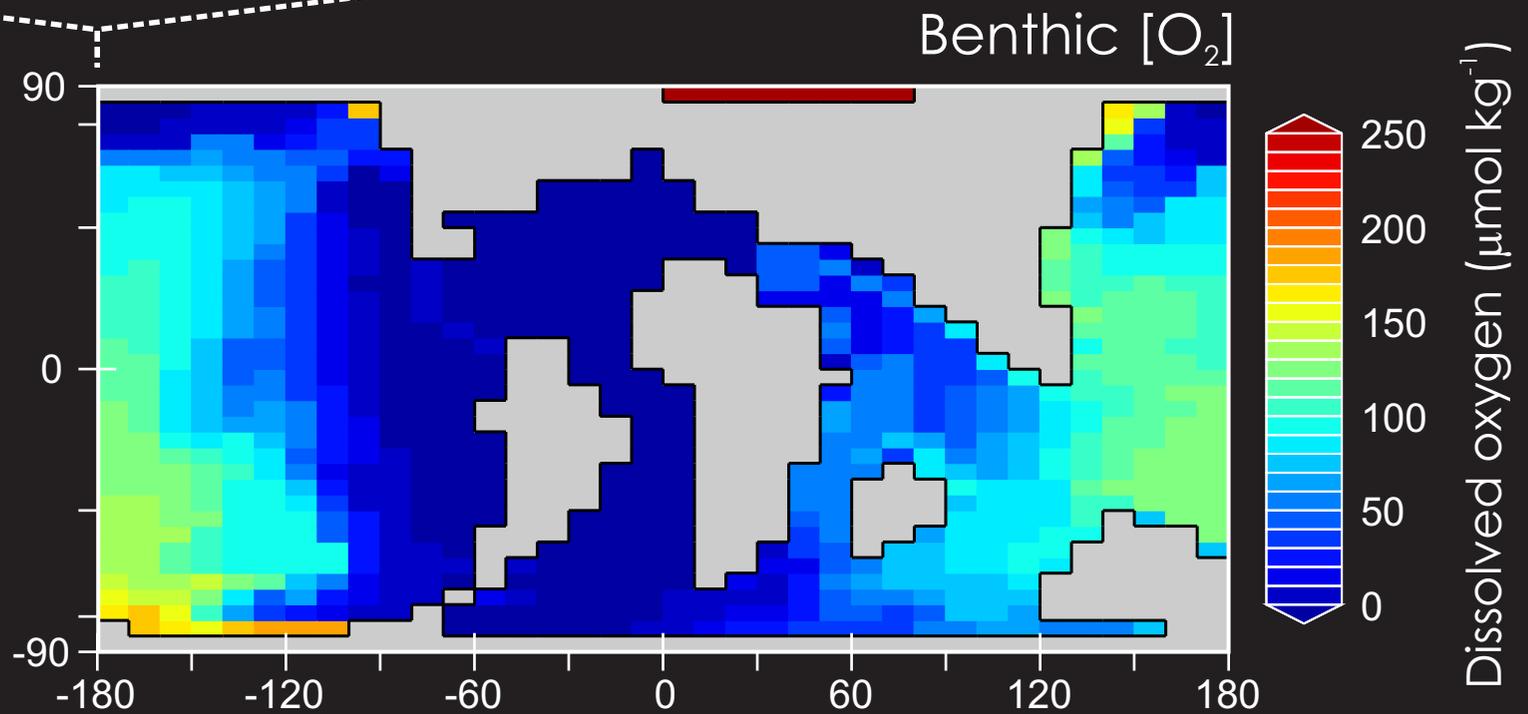

x8 CO₂ @ 10,000 yrs
(started from end of the x4 simulation)

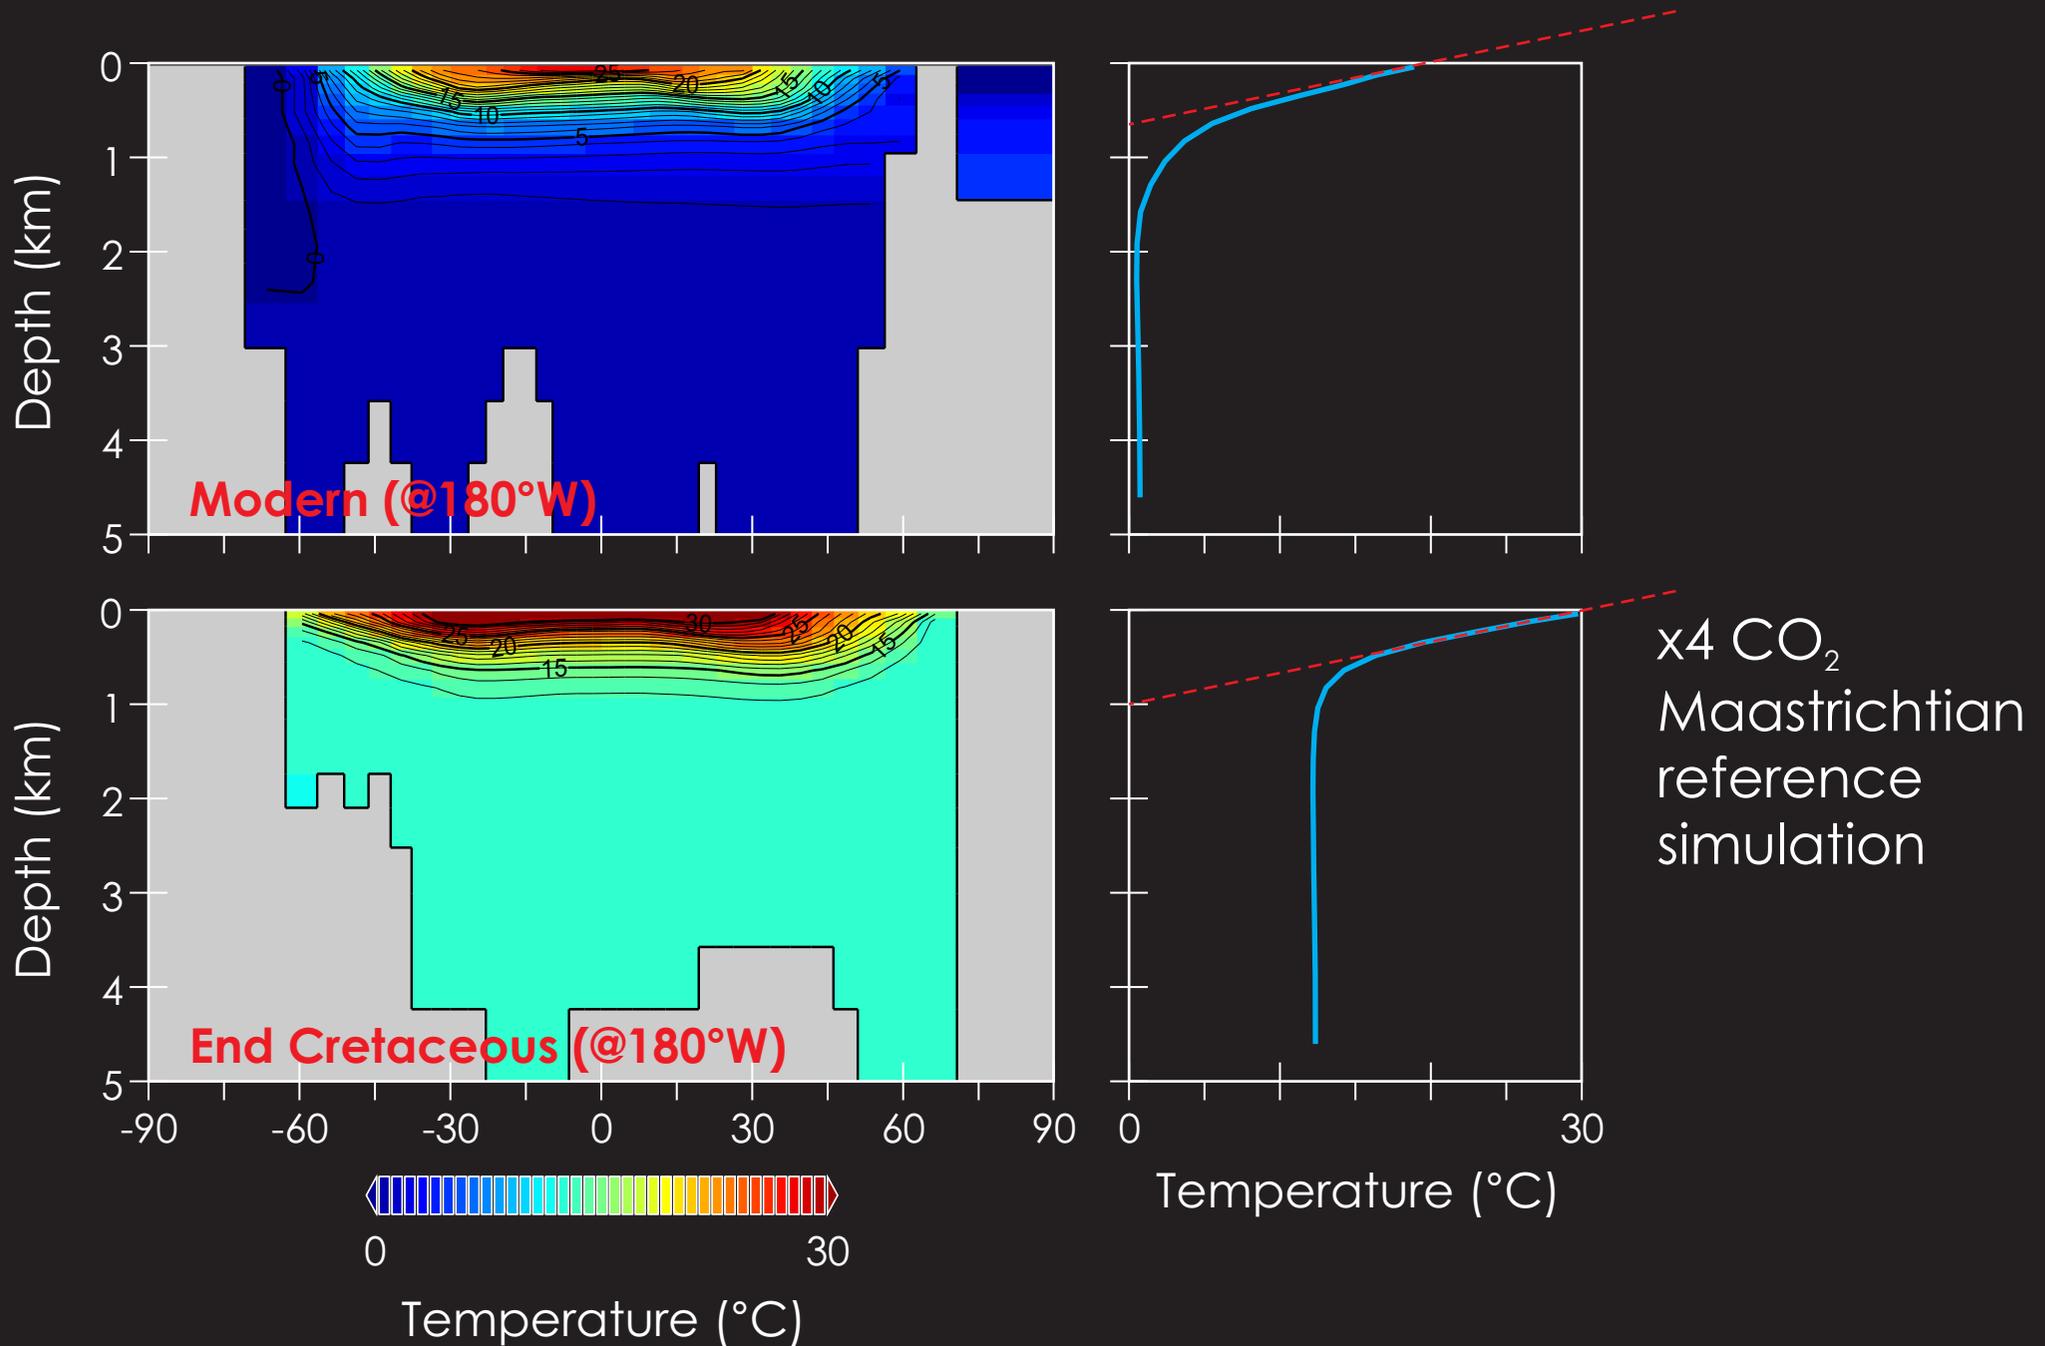

Controls on ocean oxygenation revisited: Ocean circulation in a warm climate

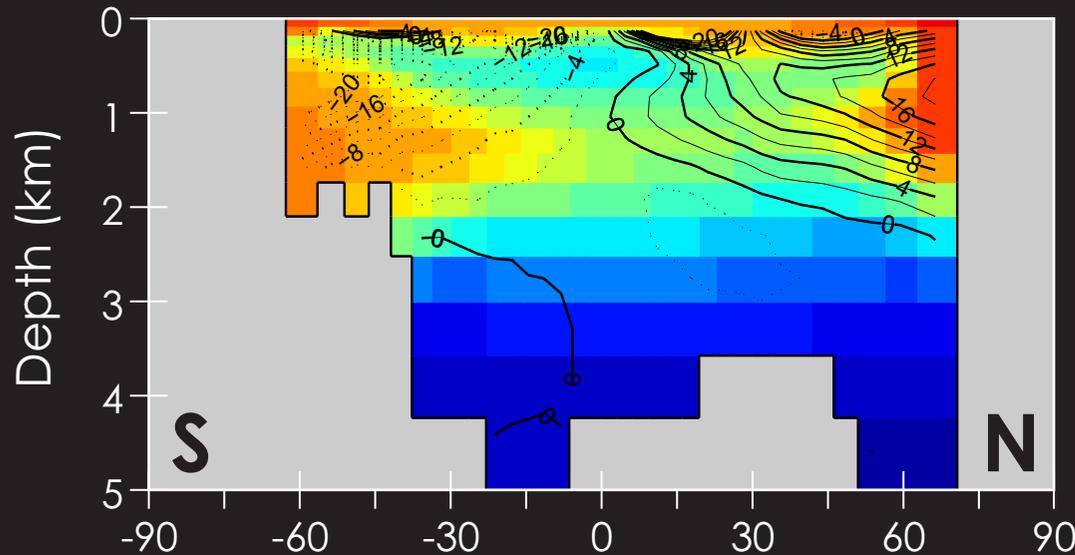

x16 CO₂ @ 10,000 yrs
(started from end of the x4 simulation)

Controls on ocean oxygenation revisited: Ocean circulation in a warm climate

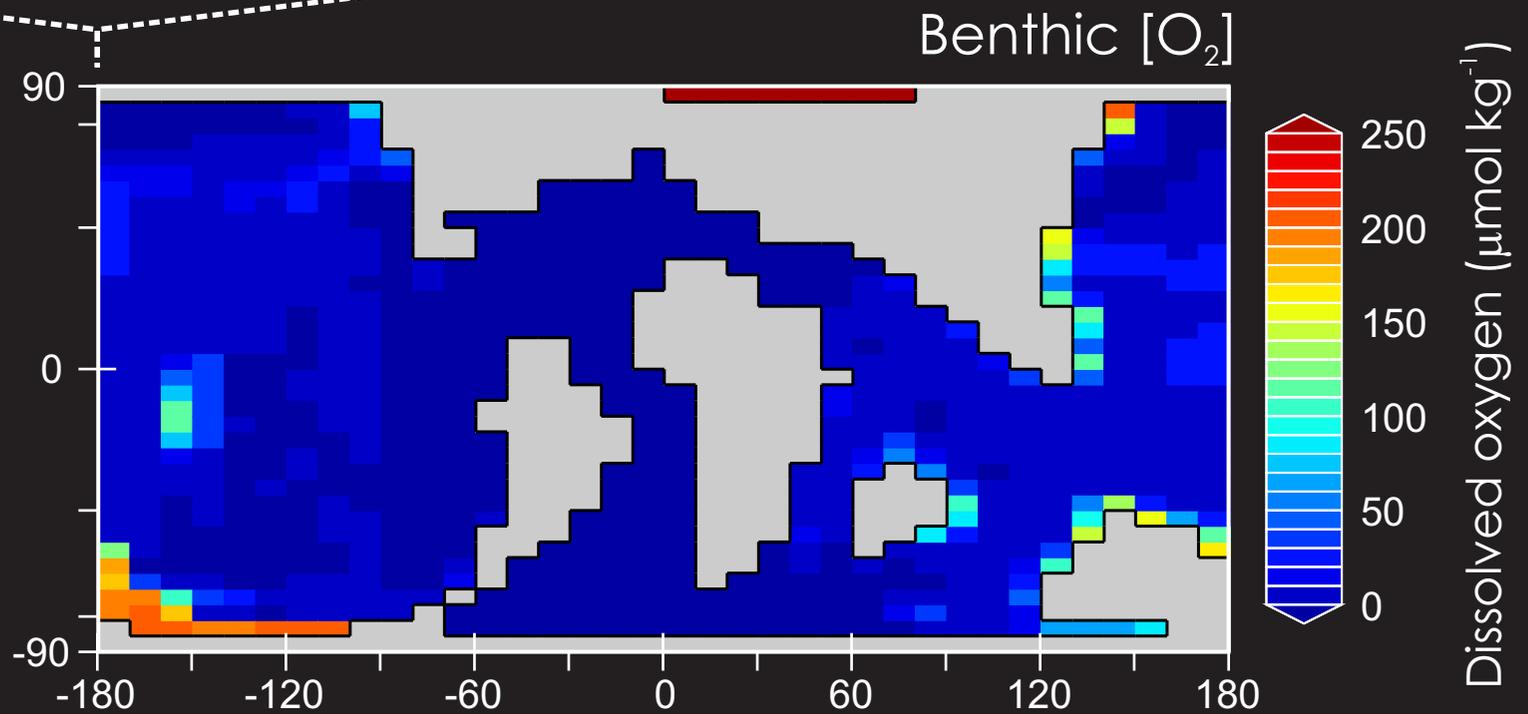

Controls on ocean oxygenation revisited: Ocean circulation in a warm climate

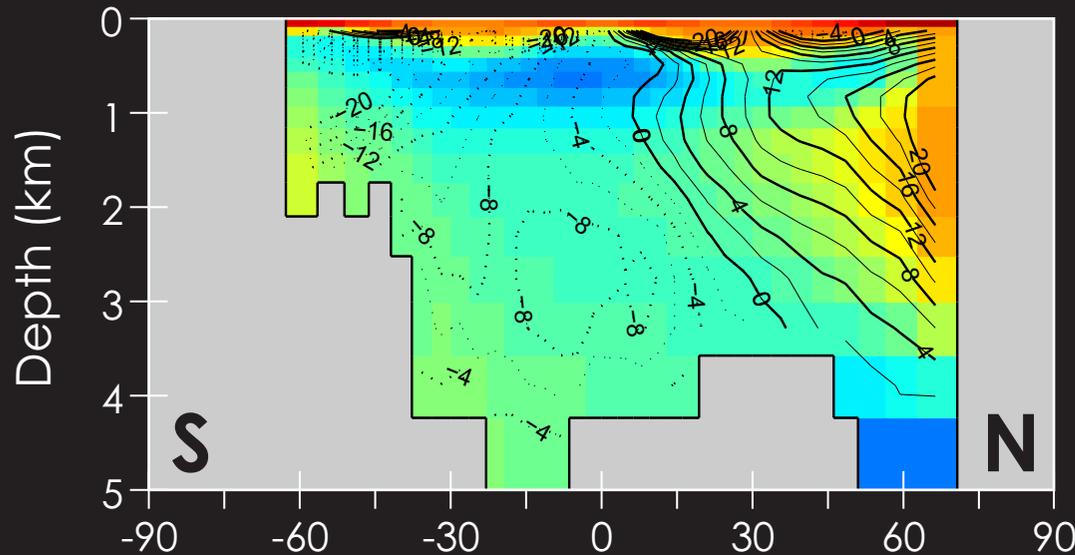

x16 CO₂ @ 2,000 yrs

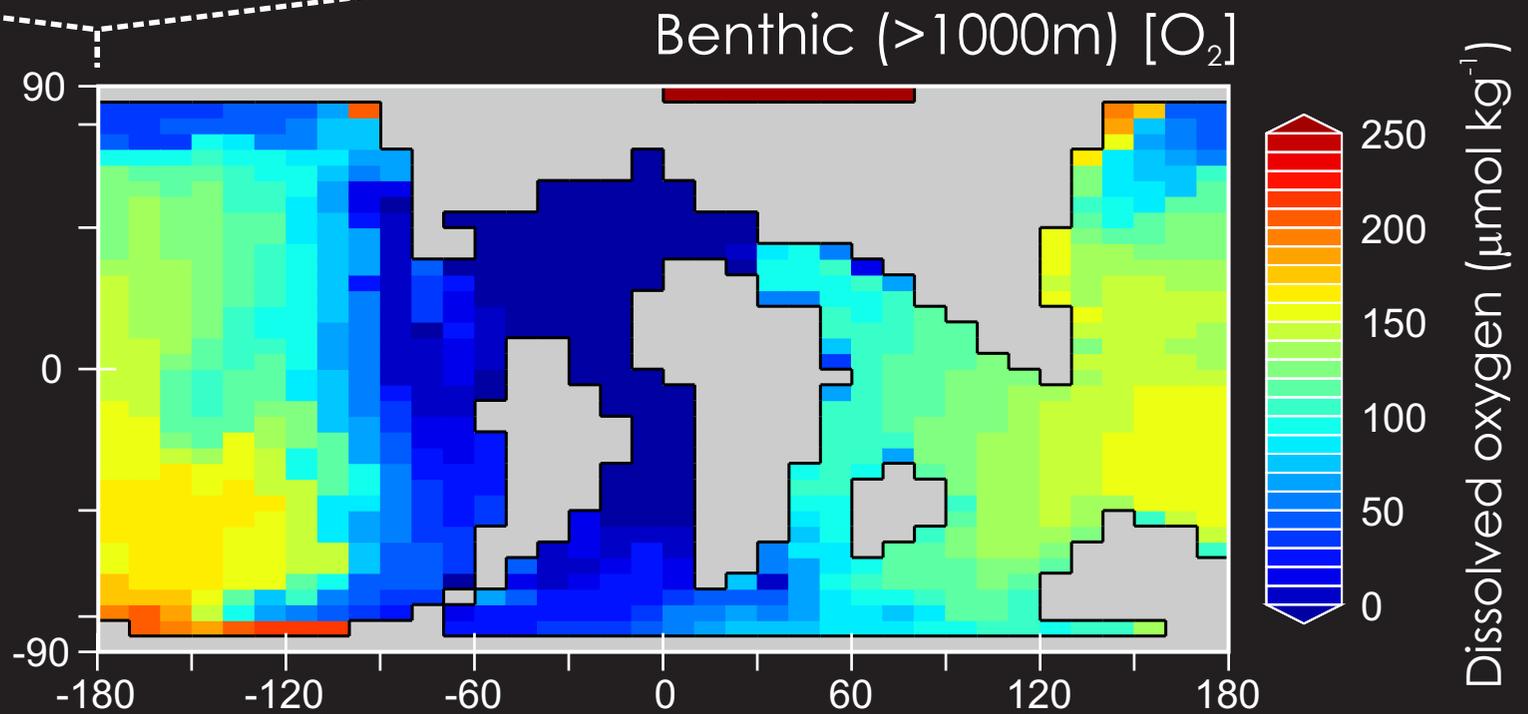

transient state
(incomplete adjustment to
increased radiative forcing)

Controls on ocean oxygenation revisited: Constraining circulation

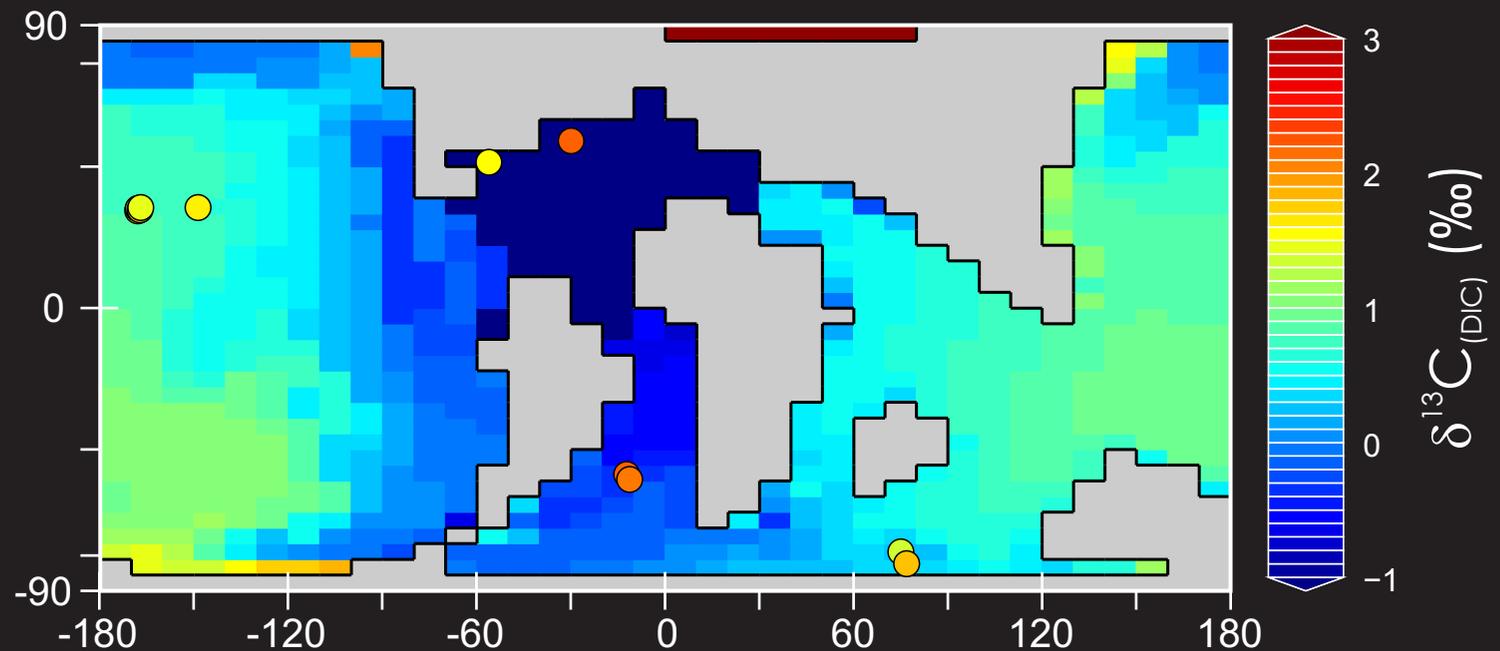

x4 CO₂ reference
simulation;
latest Maastrichtian

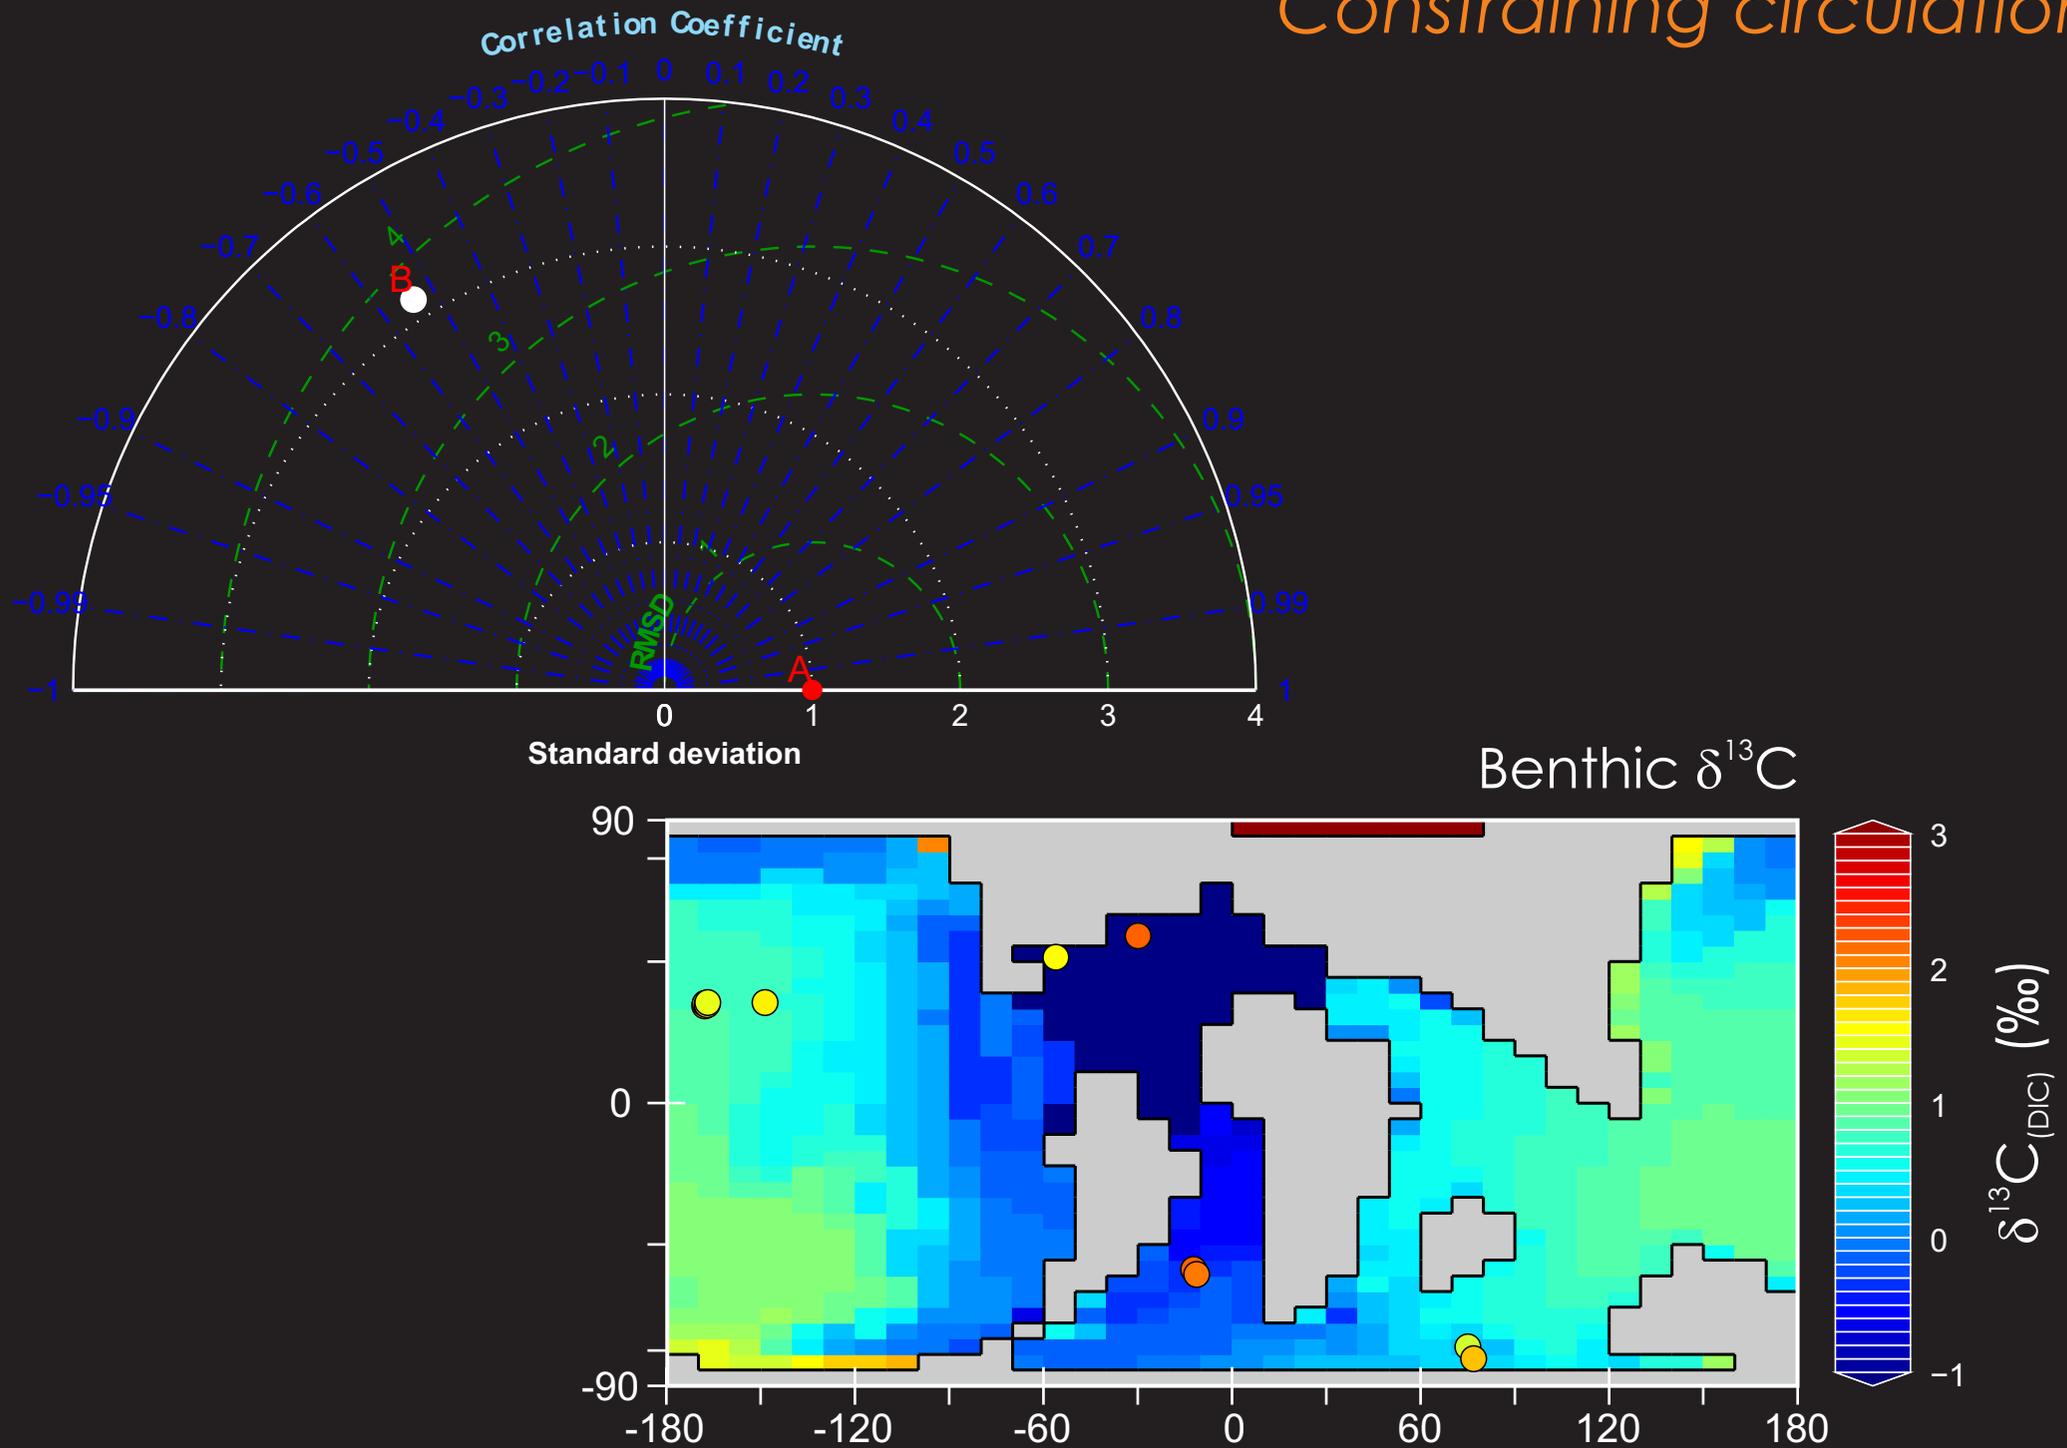

Controls on ocean oxygenation revisited: Constraining circulation

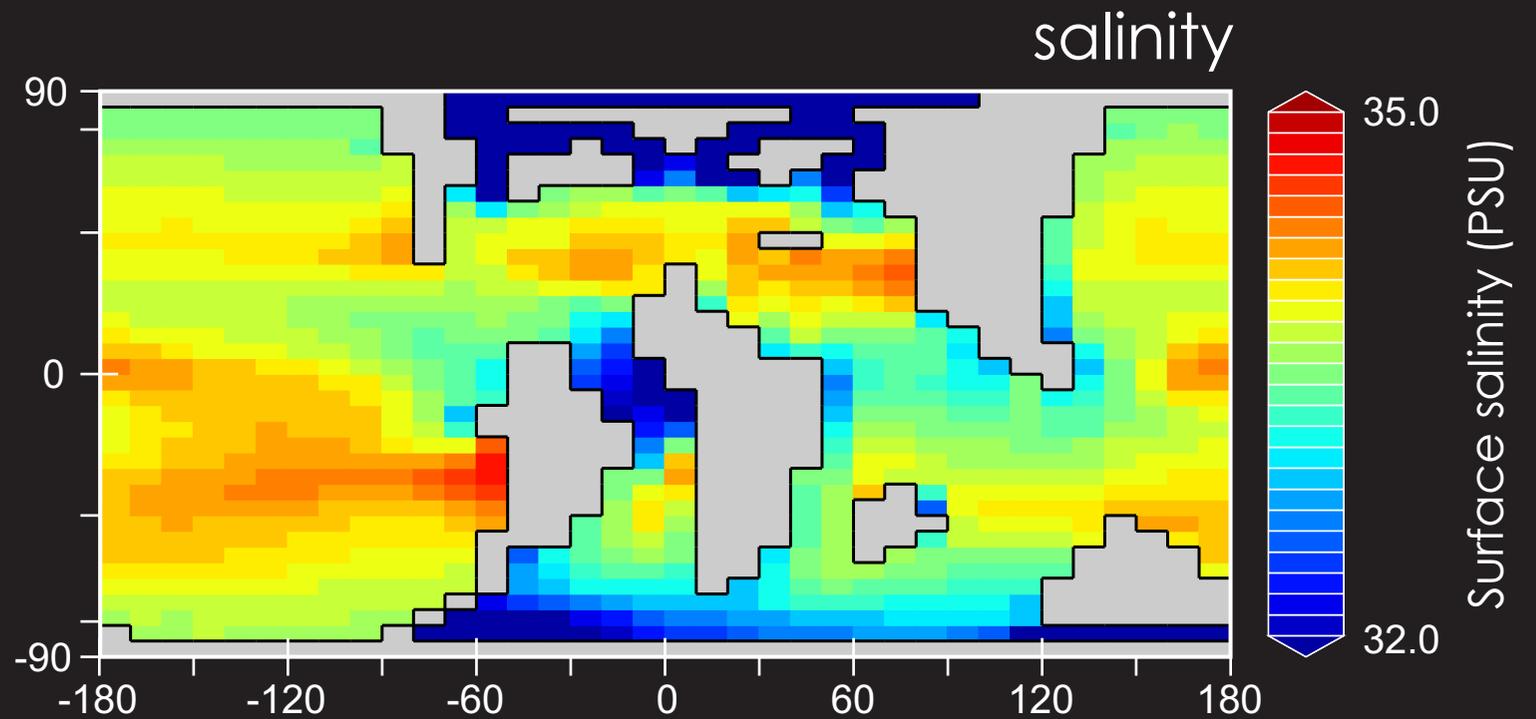

Model bottom-water $\delta^{13}\text{C}$ with benthic foraminiferal $\delta^{13}\text{C}$ overlain (Cramer '09)

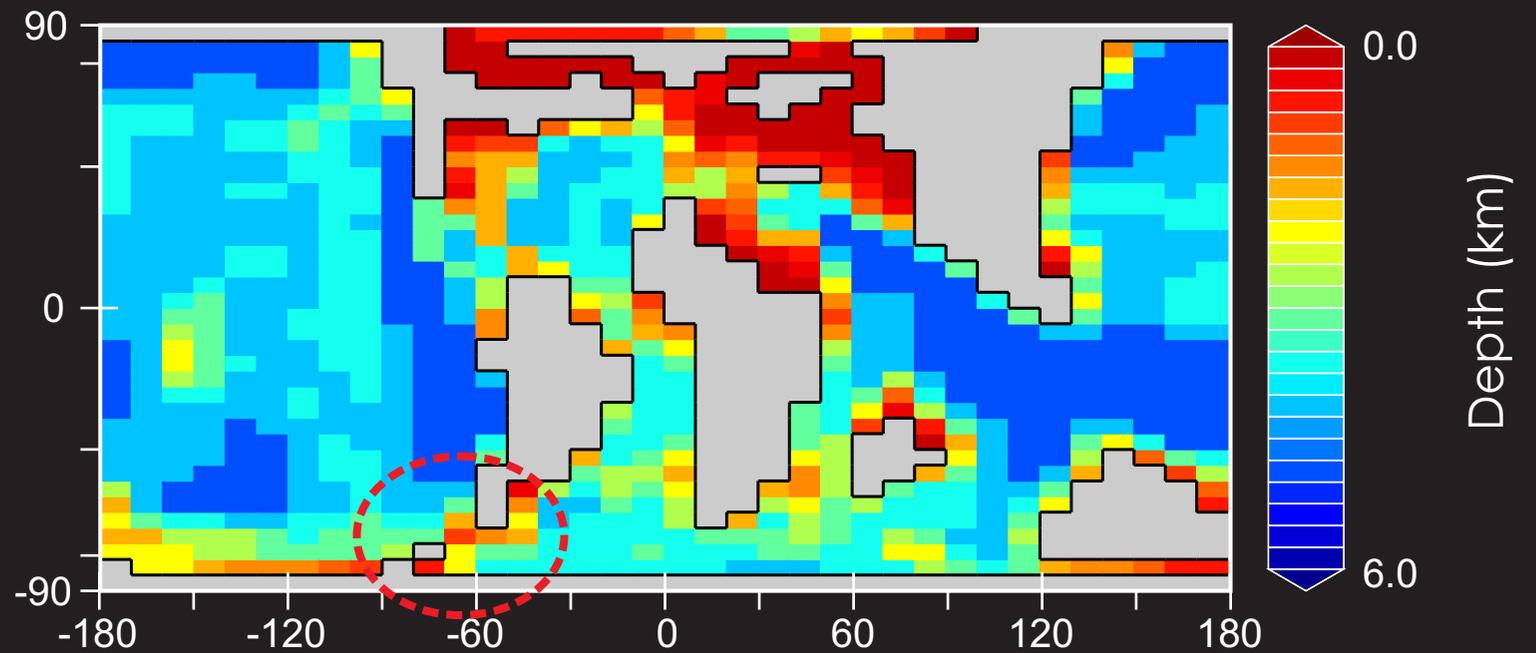

Controls on ocean oxygenation revisited: Constraining circulation

*Controls on ocean oxygenation revisited:
Constraining circulation*

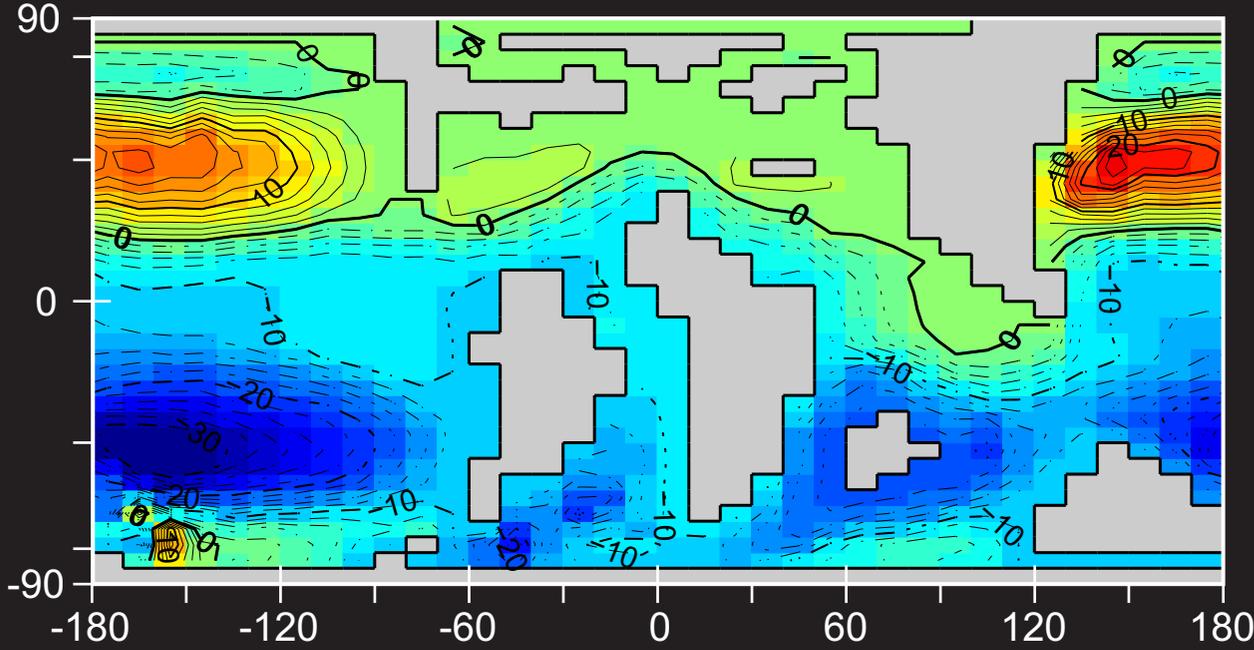

*Controls on ocean oxygenation revisited:
Constraining circulation*

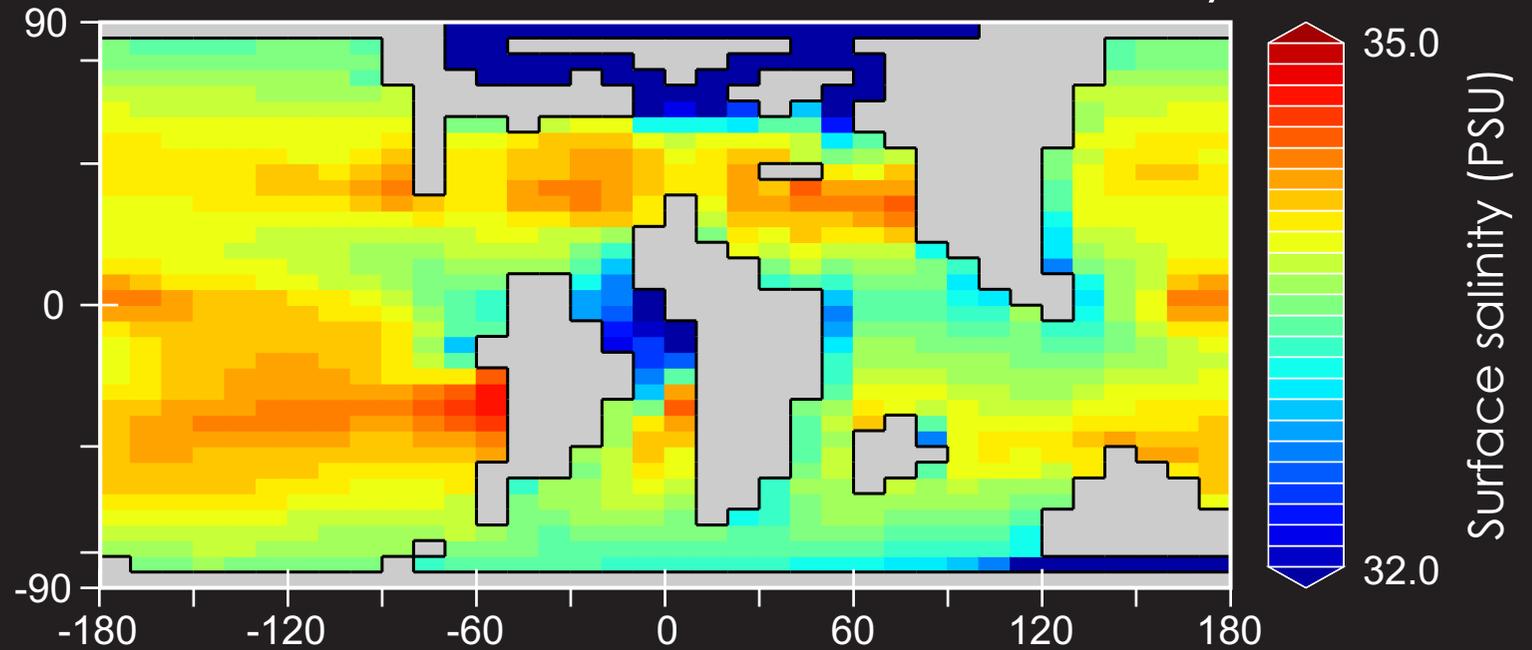

Controls on ocean oxygenation revisited: Constraining circulation

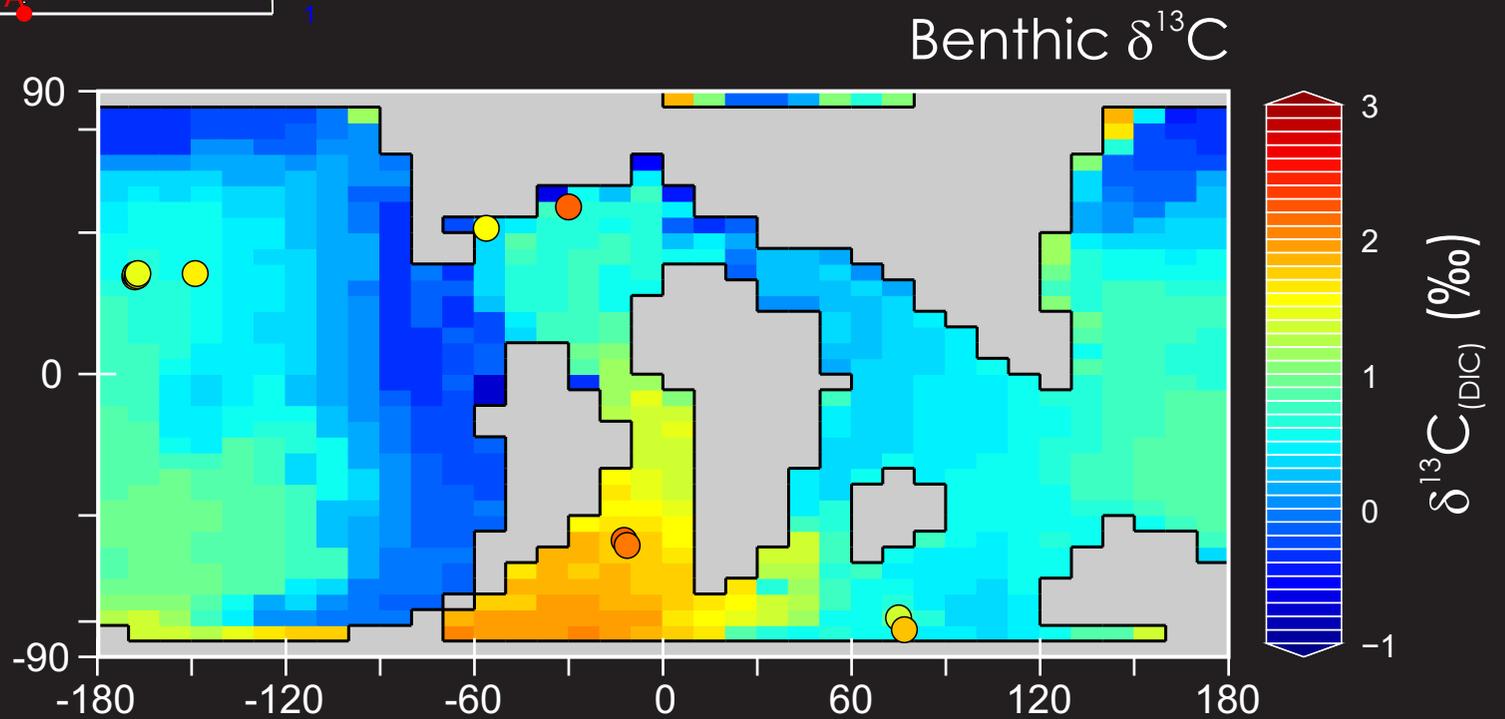

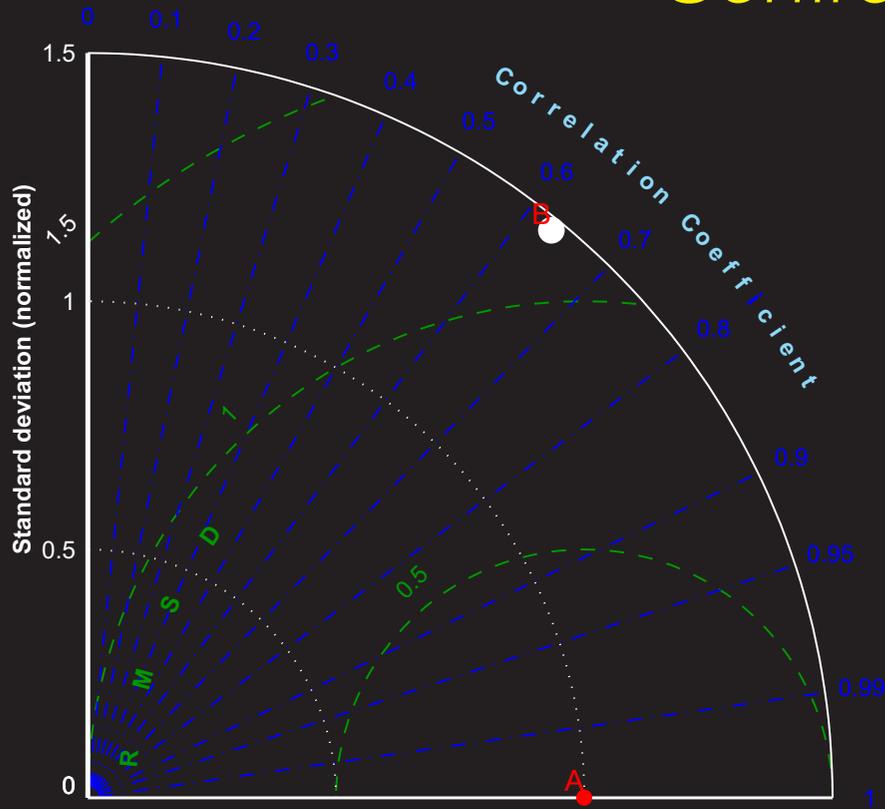

Barotropic streamfunction

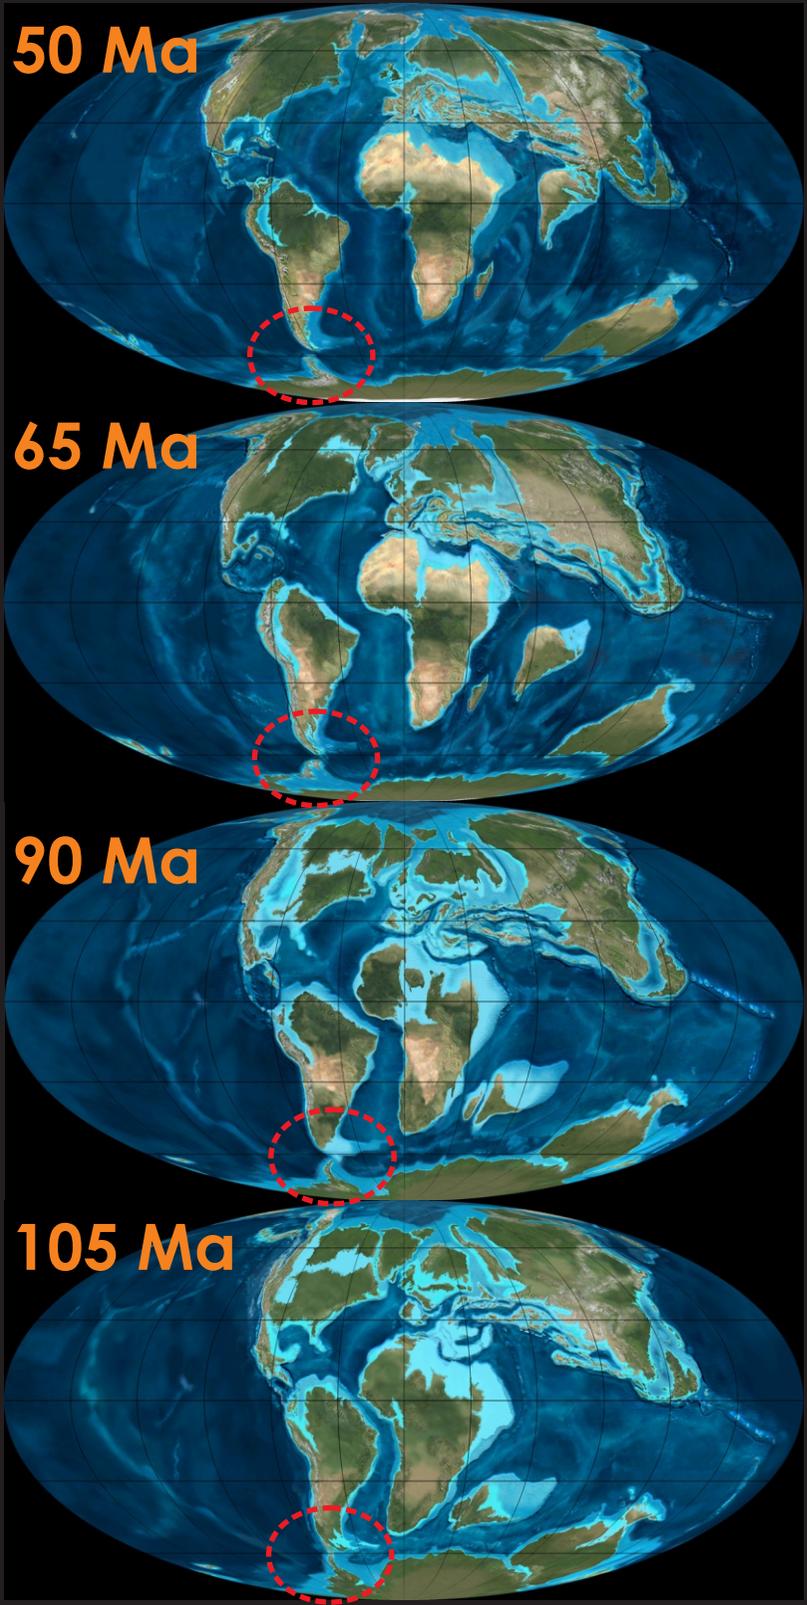

salinity

Controls on ocean oxygenation revisited: Constraining circulation

Controls on ocean oxygenation revisited: Tectonics and ocean gateways

Changing degrees of connectivity between the SE Pacific and SW Atlantic from the late Jurassic until the full 'opening' of the Drake Passage could have controlled (in combination with climate and local runoff) deep-water production in the S. Atlantic.

From ca. mid Cretaceous times, S. Atlantic sourced deepwater might have helped ventilate the N. Atlantic.

Think of the S. Atlantic and tectonic relationship in the same way as 'shallow time' N. Atlantic AMOC and the Panamanian gateway(?)

Conclusions/perspectives:

Deep-sea benthic $\delta^{13}\text{C}$ (post Jurassic age questions) gradients to constrain the pathway of oxygenation (taking with additional constraints on ocean circulation from e.g. Nd).

Statistical tests in assessing model vs. data (and importance of adequate model spin-up).

General importance of a wide-ranging multi-proxy approach (David Naafs talk).

Changing ocean gateways in the South Atlantic as a possible preconditioner for ocean oxygenation sensitivity to climatic perturbation.

Go play with the model (after beer) ...
