

Evolution of the Ocean's Biological Pump (*in silico*)

Andy Ridgwell

Evolution of the Biological Pump

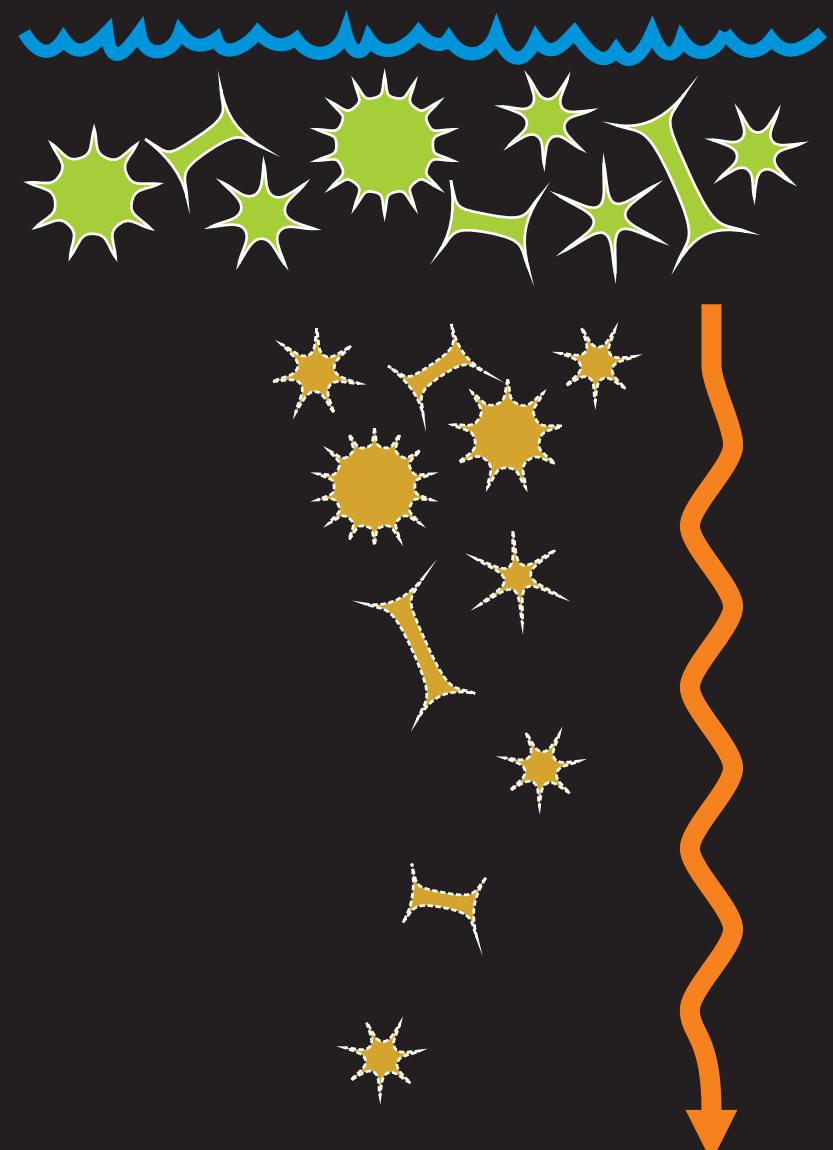

The processes that govern the partitioning of carbon (and alkalinity) between the surface ocean (and hence atmosphere) and ocean interior, are traditionally described in terms of three conceptual 'pumps':

- (1) The 'solubility' pump.
- (2) The 'organic matter' (or 'soft tissue') pump.
- (3) The 'carbonate' (or 'counter') pump.

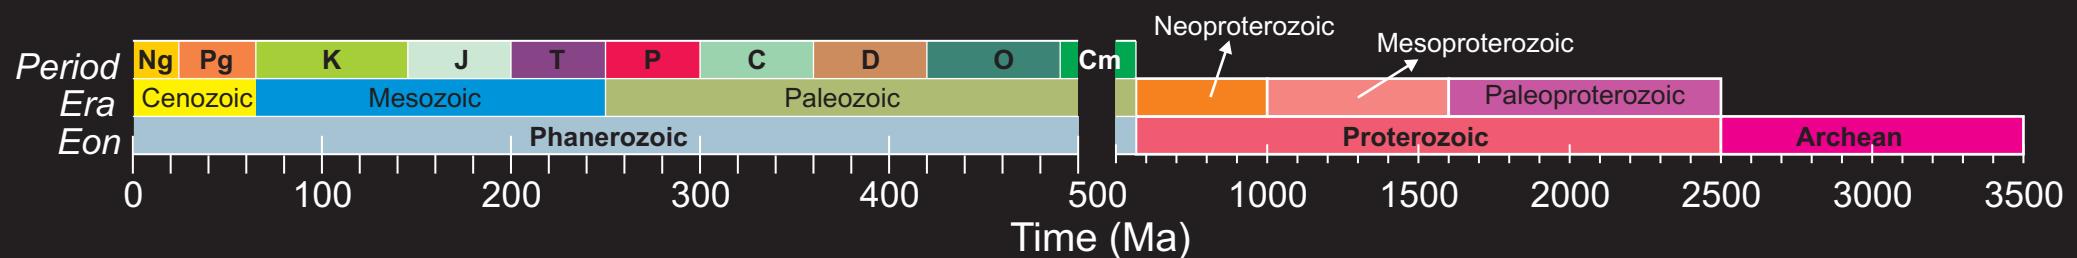

This conceptual framework has more recently extended by a fourth component:

- (4) the microbial carbon pump.

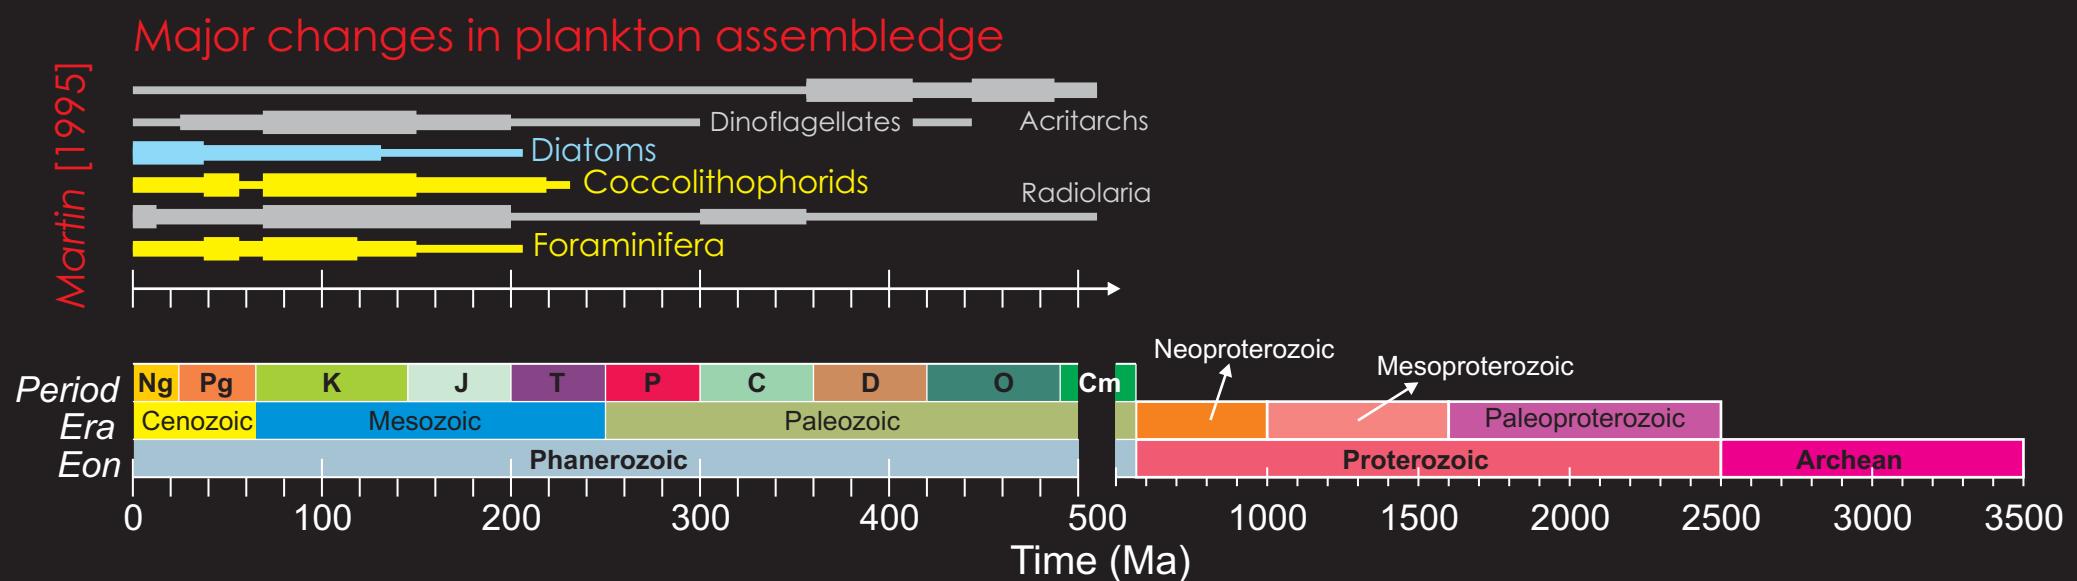

, the biological pump

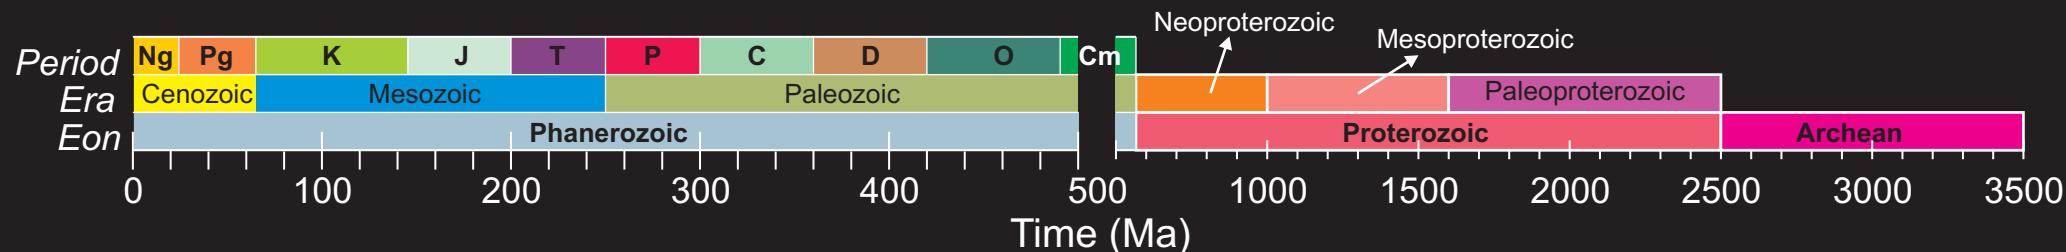

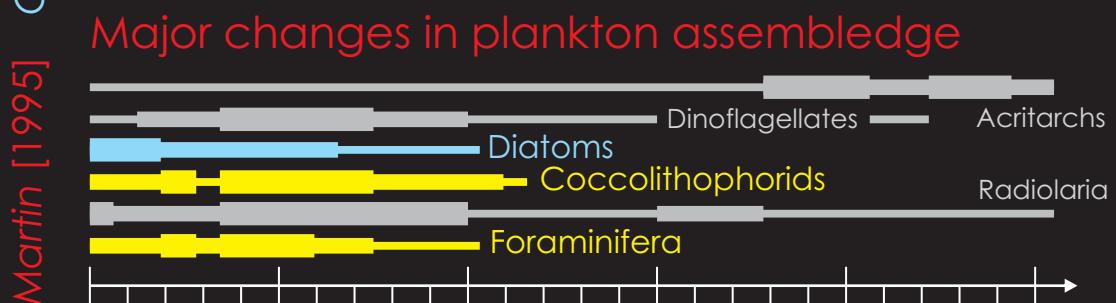

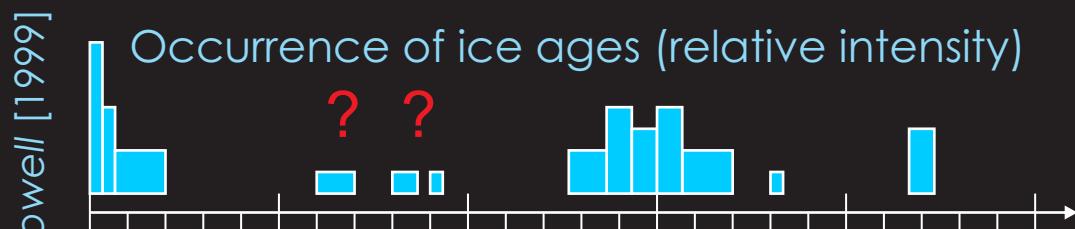

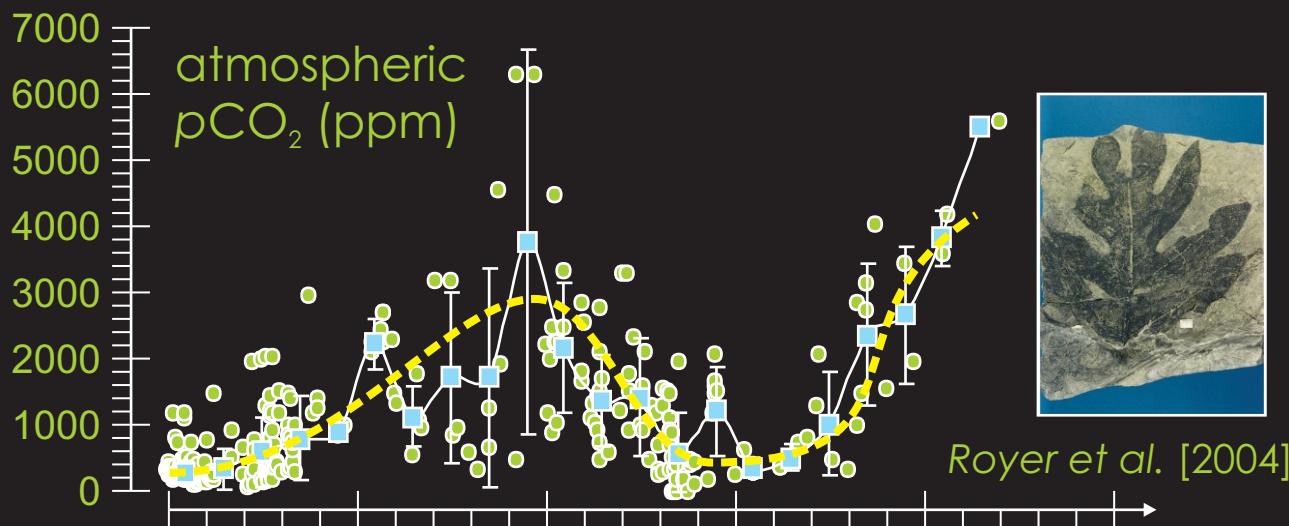

Evolution of the Biological Pump

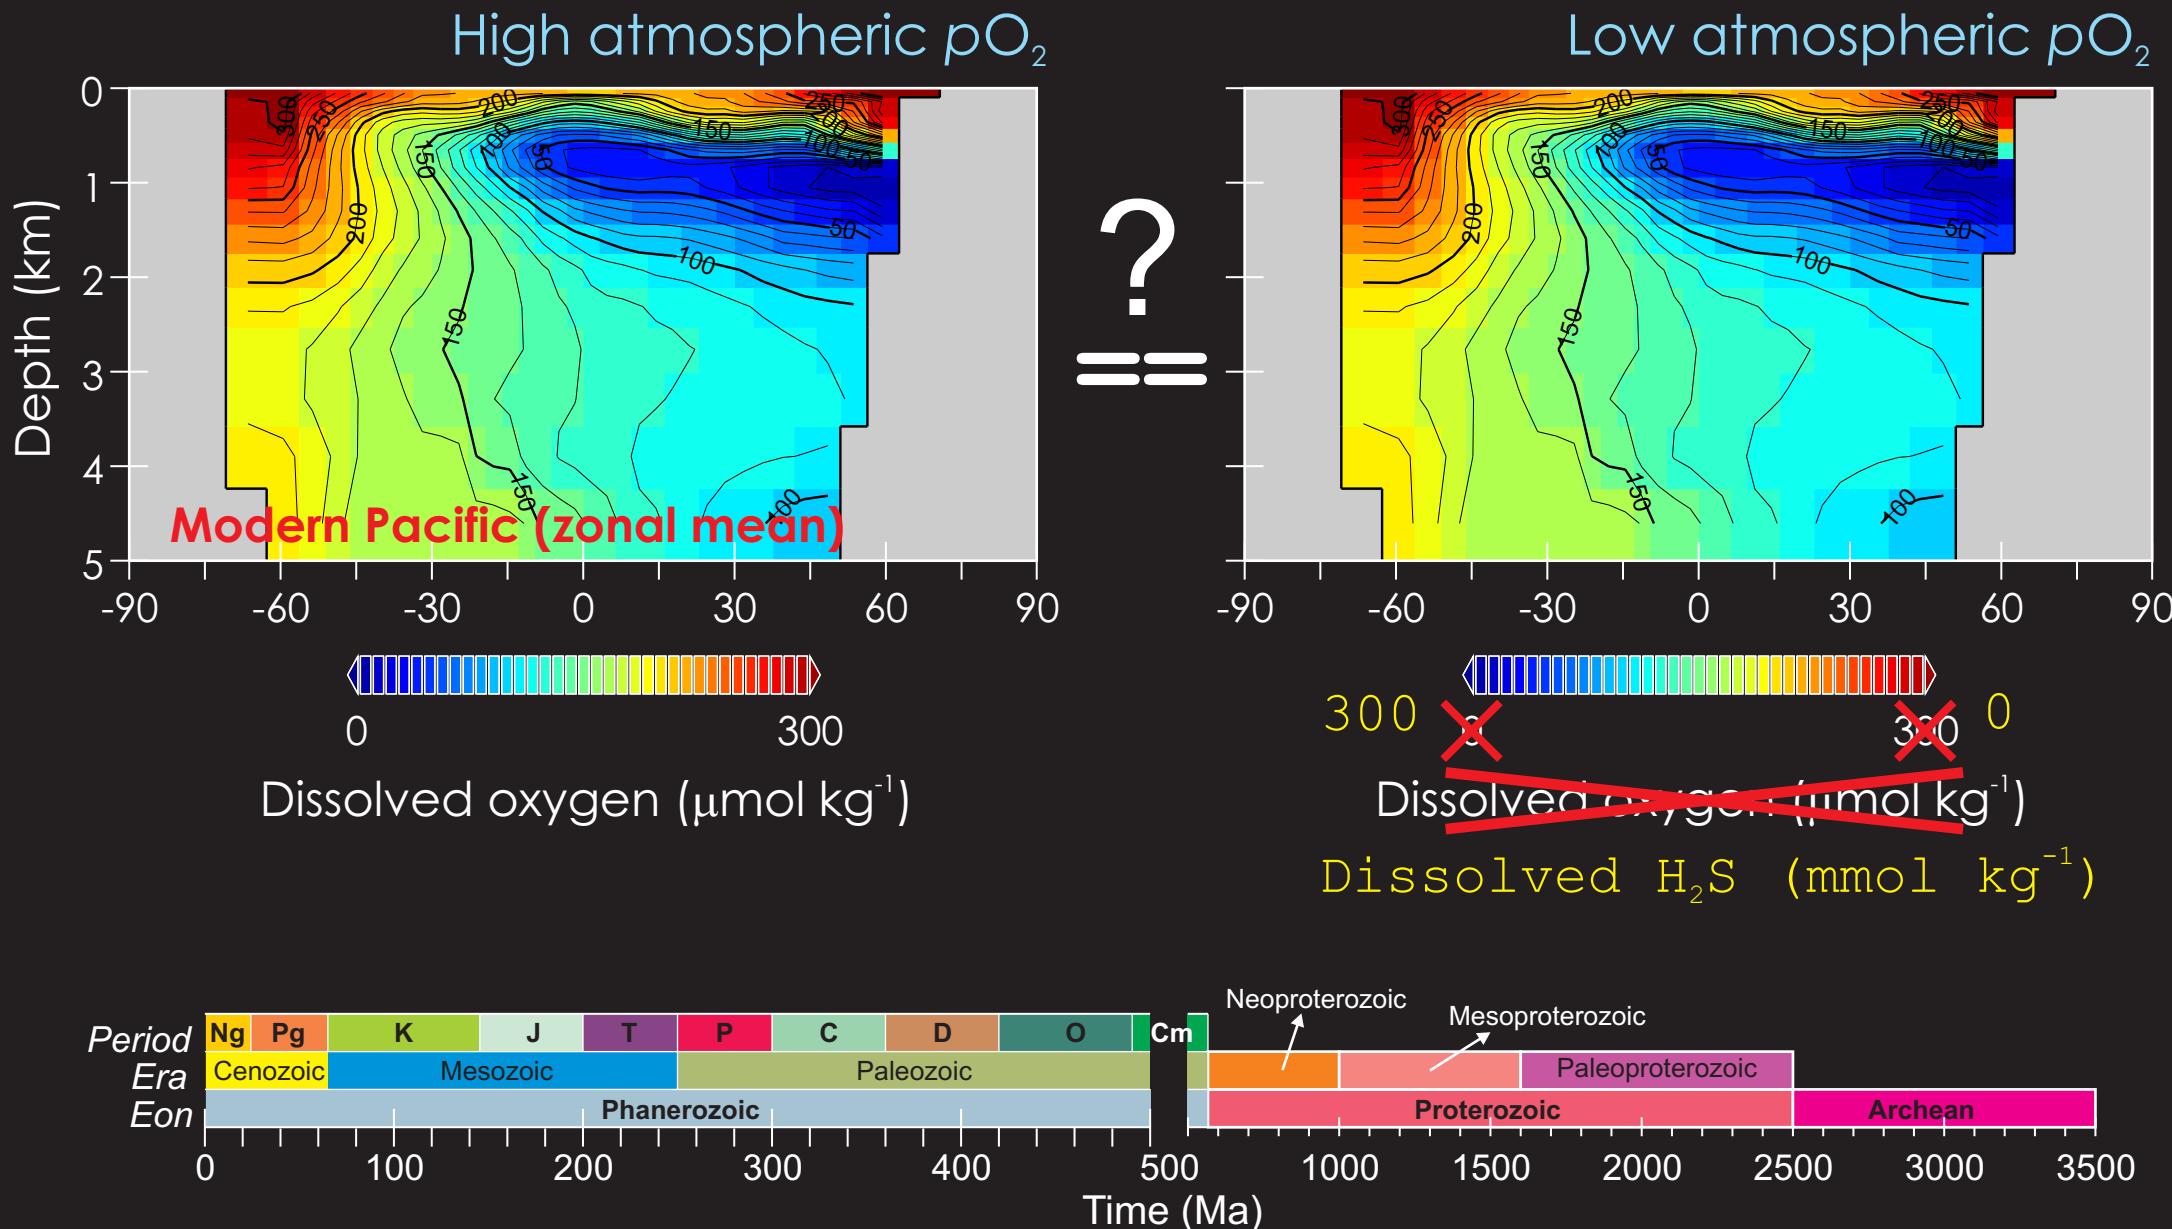

Evolution of the Biological Pump

Evolution of the Biological Pump

Evolution of the Biological Pump

Evolution of the Biological Pump: TALK OUTLINE

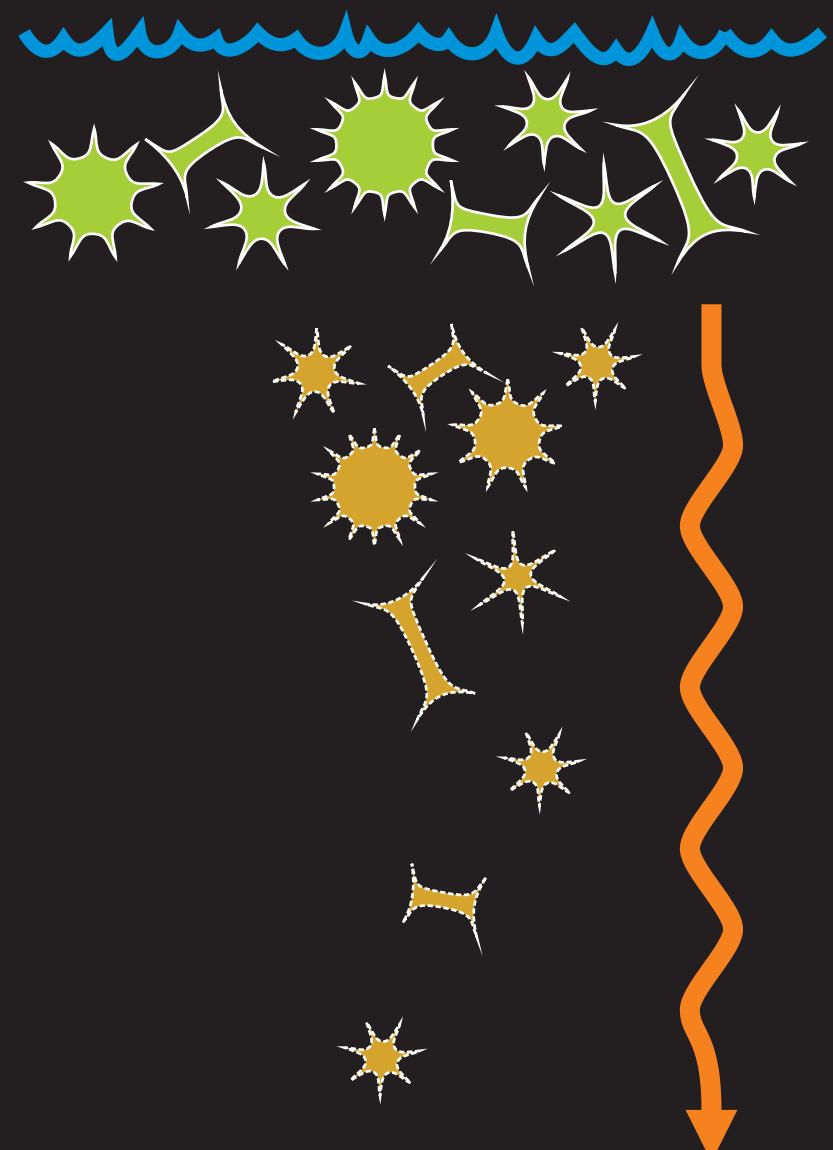

(1) Interrogating the biological pump
in silico.

(2) The fundamental importance ...
or not, of the advent of pelagic
calcification and mineral ‘ballasting’
of particulate organic matter fluxes.

(3) Extinctions as a window onto the
biological pump components:
The end-K as an example.

(4) The fundamental importance ...
or not, of physical ocean changes
and esp. warming.

(5) What came before the (vertical)
particulate carbon pump?

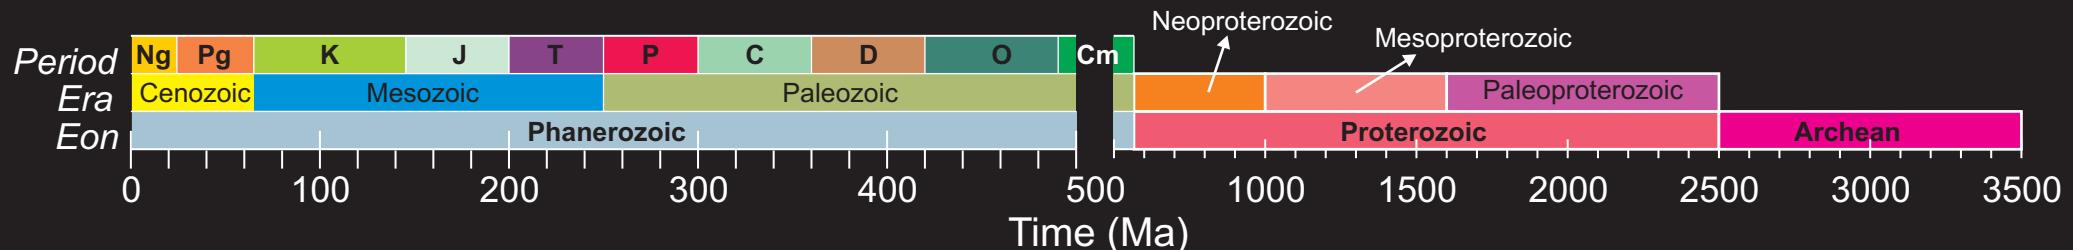

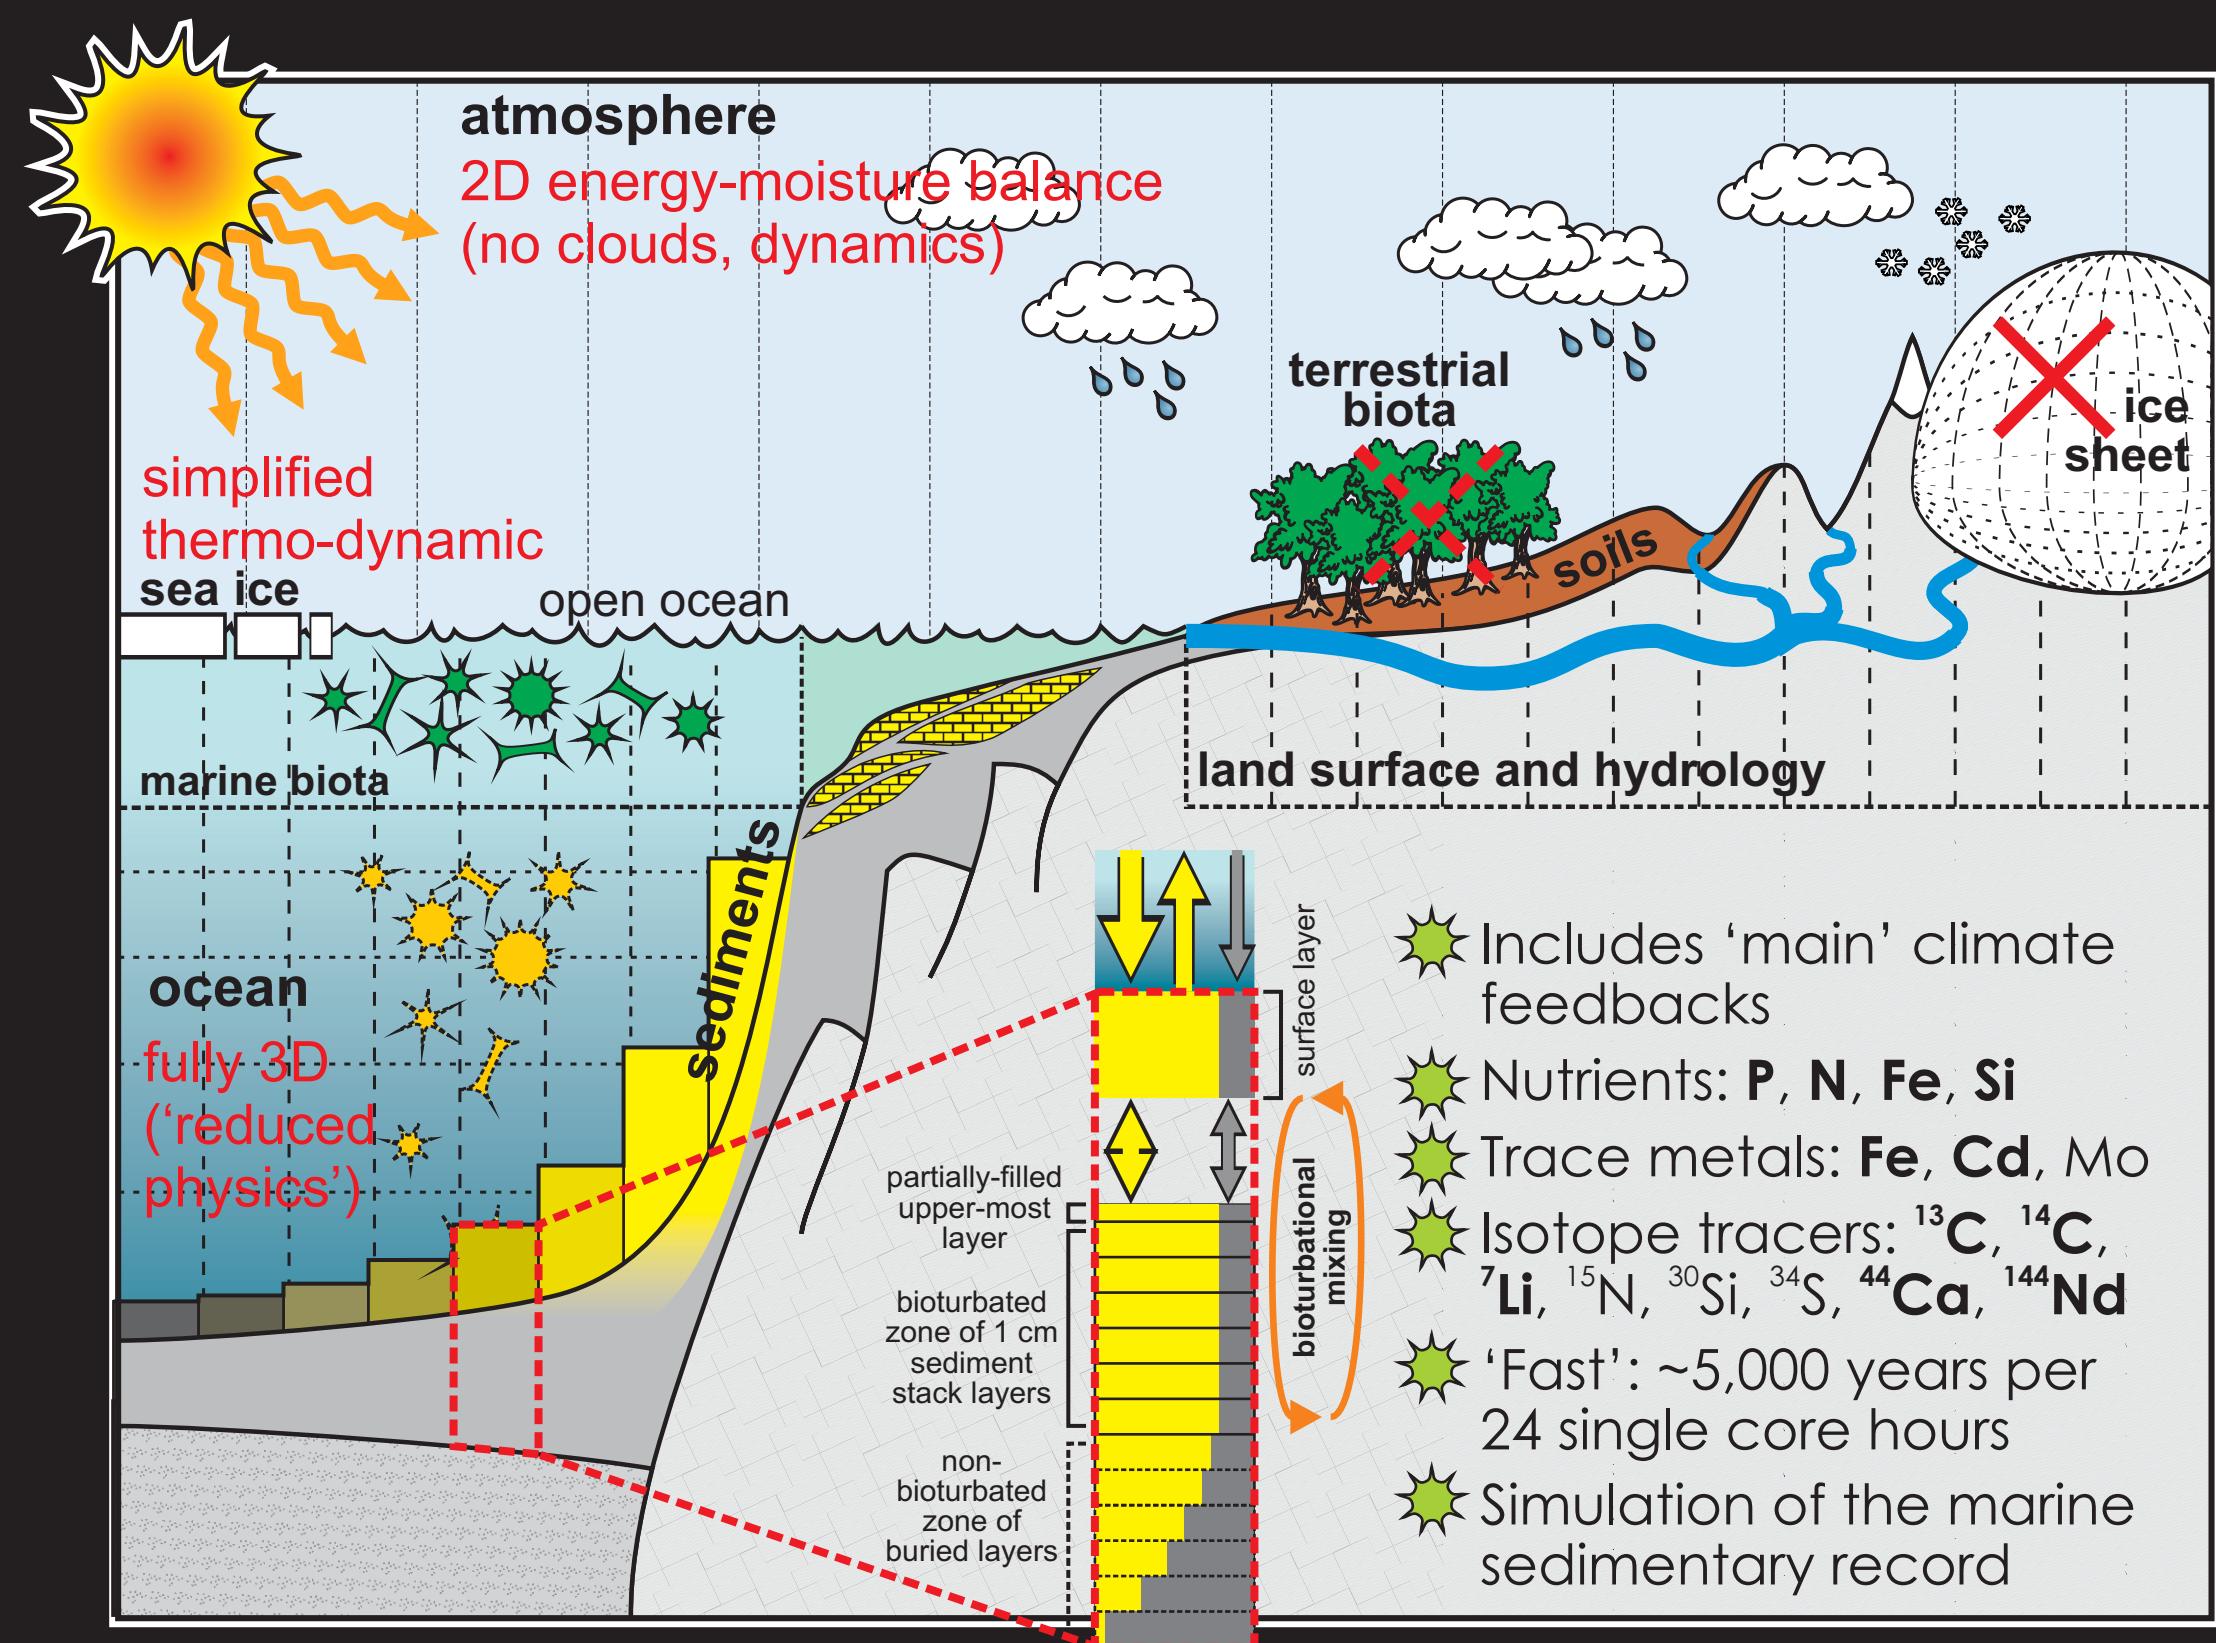

Evolution of the Biological Pump: in silico

```

! calculate carbonate alkalinity
loc_ALK_DIC = dum_ALK &
& - loc_H4BO4 - loc_OH - loc_HPO4 - 2.0*loc_PO4 - loc_H3SiO4 - loc_NH3 - loc_HS &
& + loc_H + loc_HSO4 + loc_HF + loc_H3PO4
! estimate the partitioning between the aqueous carbonate species
loc_zed = ( &
& (4.0*loc_ALK_DIC + dum_DIC*dum_carbconst(icc_k) - 
loc_ALK_DIC*dum_carbconst(icc_k))**2 + &
& 4.0*(dum_carbconst(icc_k) - 4.0)*loc_ALK_DIC**2 &
& )**0.5 loc_conc_HCO3 = (dum_DIC*dum_carbconst(icc_k) - 
loc_zed) / (dum_carbconst(icc_k) - 4.0)
loc_conc_CO3 = &
& ( &
& loc_ALK_DIC*dum_carbconst(icc_k) - dum_DIC*dum_carbconst(icc_k) - &
& 4.0*loc_ALK_DIC + loc_zed &
& ) &
& /(2.0*(dum_carbconst(icc_k) - 4.0))
loc_conc_CO2 = dum_DIC - loc_ALK_DIC + &
& ( &
& loc_ALK_DIC*dum_carbconst(icc_k) - dum_DIC*dum_carbconst(icc_k) - &
& 4.0*loc_ALK_DIC + loc_zed &
& ) &
& /(2.0*(dum_carbconst(icc_k) - 4.0))
loc_H1 = dum_carbconst(icc_k1)*loc_conc_CO2/loc_conc_HCO3
loc_H2 = dum_carbconst(icc_k2)*loc_conc_HCO3/loc_conc_CO3

```

cGENIE UCSC 2014 version: README

Andy Ridgwell

February 21, 2014

1. To get an exact (read-only) copy of the ('muffin' development branch)cGENIE source code used for the UCSC presentation – in linux, (ideally from your homedirectory) type:

```
svn co https://svn.ggy.bris.ac.uk/subversion/genie/tarball gs/cgenie.UCSC2014  
--username=genie-user cgenie.muffin
```

NOTE: All this must be typed continuously on ONE LINE, with a S P A C E before '--username', and before 'cgenie'. You will be asked for a password – it is g3n1e-user.

2. You need to set a couple of environment variables – the compiler name, netCDF library name, and netCDF path. These are specified in the file user.mak (genie-main directory). If the cgenie code tree (cgenie.muffin) and output directory (cgenie_output) are installed anywhere other than in your account HOME directory, paths specifying this will have to be edited in: user.mak and user.sh (genie-main directory). Installing the model code under the default directory name (cgenie.muffin) in your HOME directory is hence by far the simplest and avoids incurring additional/unnecessary pain (configuration complexity) ...

You will also need to have installed or linked to an appropriate FORTRAN compiler and netCDF library (built with the same FORTRAN compiler). The GNU FORT RAN compiler (gfort) version 4.4.4 or later is recommended. The netCDF version needs to be 4.0 (more recent versions require a little work-around, not documented here ...).

3. To test the code installation – change directory to cgenie.muffin/genie-main and type:

```
make testbiogem
```

This compiles a carbon cycle enabled configuration of GENIE and runs a short test, comparing the results against those of a pre-run experiment (also downloaded alongside the model source code). It serves to check that you have the software environment correctly configured. If you are unsuccessful here ... double-check the software and directory environment settings in user.mak (or user.sh) and for a netCDF error, check the value of the NETCDFIRENvironment variable. (Refer to the User Manual for additional fault-finding tips.) If environment variables are changed: before re-trying the test, you will need to type:

```
make cleanall
```

That is it for the basic installation. To run the model it is a simple matter of calling the 'runmuffin.sh' shell script from genie-main and supplying a couple of parameter values, e.g.:

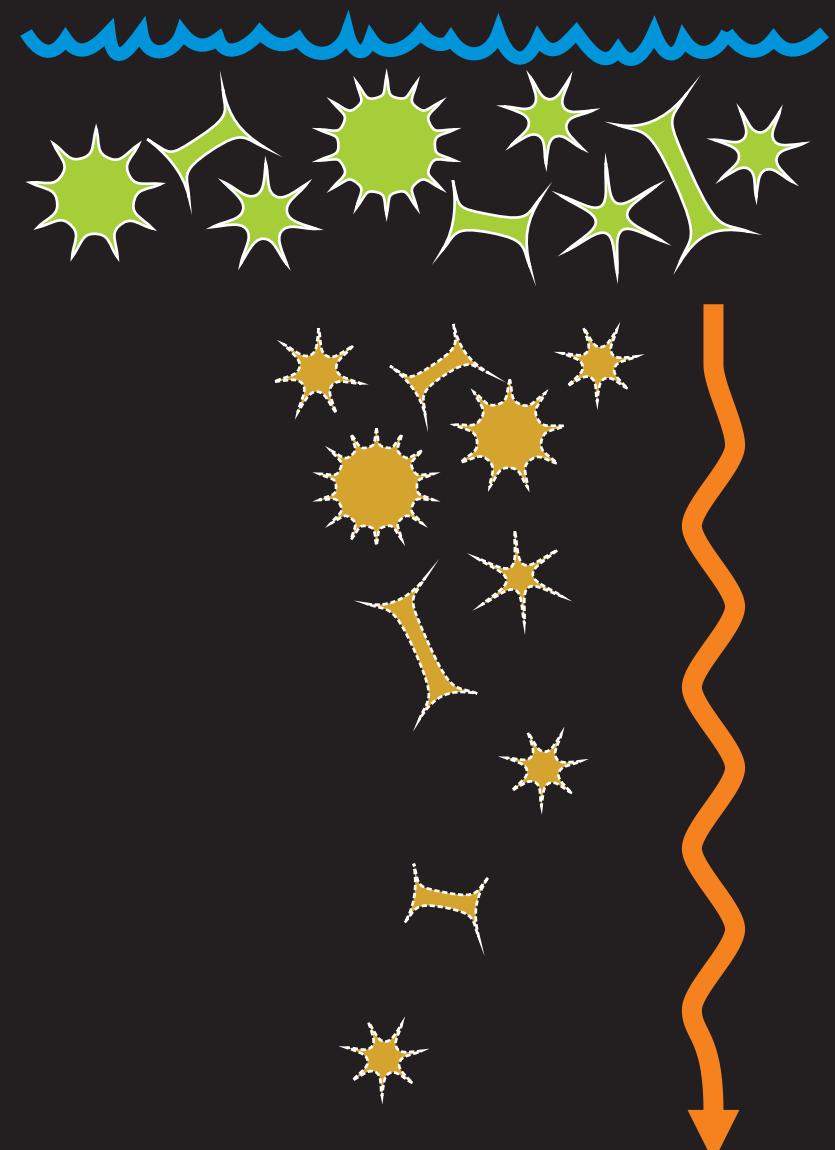

```
./runmuffin.sh cgenie.eb_go_gs_ac_bg.worjh2.ANT / EXAMPLE.worjh2.Caoetal2009.SPIN 10000
```

Refer to the cGENIE User manual for more information regarding installing, running, and analyzing model output, and cGENIE Examples for more information on this specific example.¹ Also read the cGENIE README

Highly recommended ... is in order to have a working appreciation of the structure of the model and output, plus the format of the model output and how to visualize it – to read through:

http://www.seao2.info/cgenie/labs/EC4.2013/GEOGM1110andM1404.2013-14.cGENIE_LAB.0000.pdf

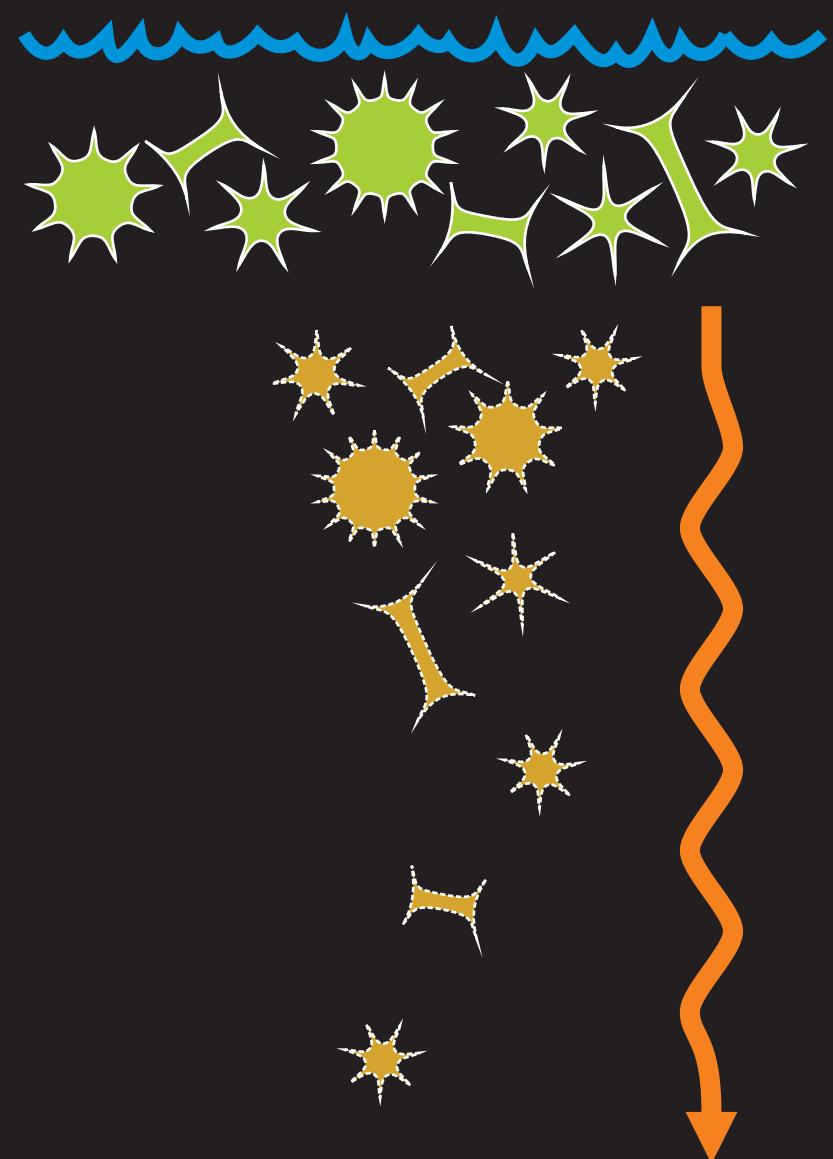

(which serves as a basic introduction to the model and how to use it).

Evolution of the Biological Pump: The Role of Dissolved organic matter (DOM)?

Evolution of the Biological Pump: The Role of Dissolved organic matter (DOM)?

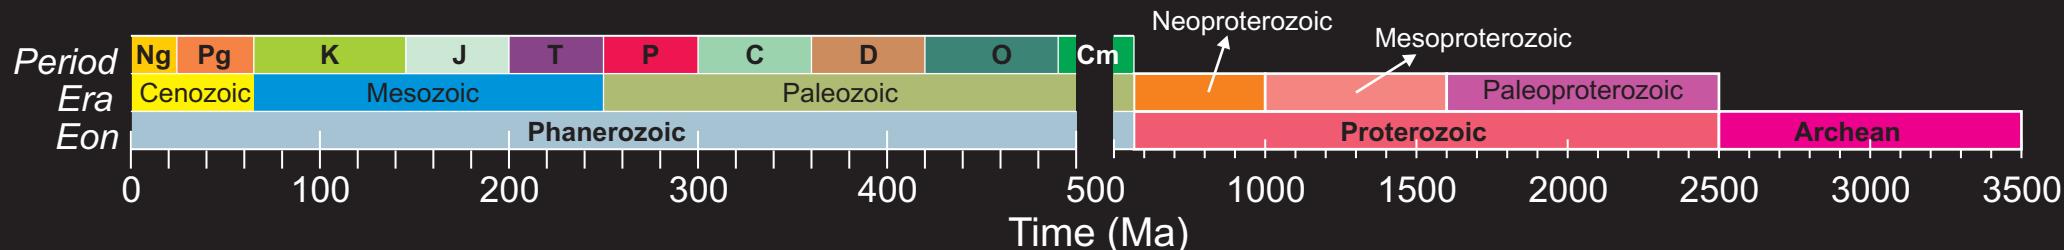

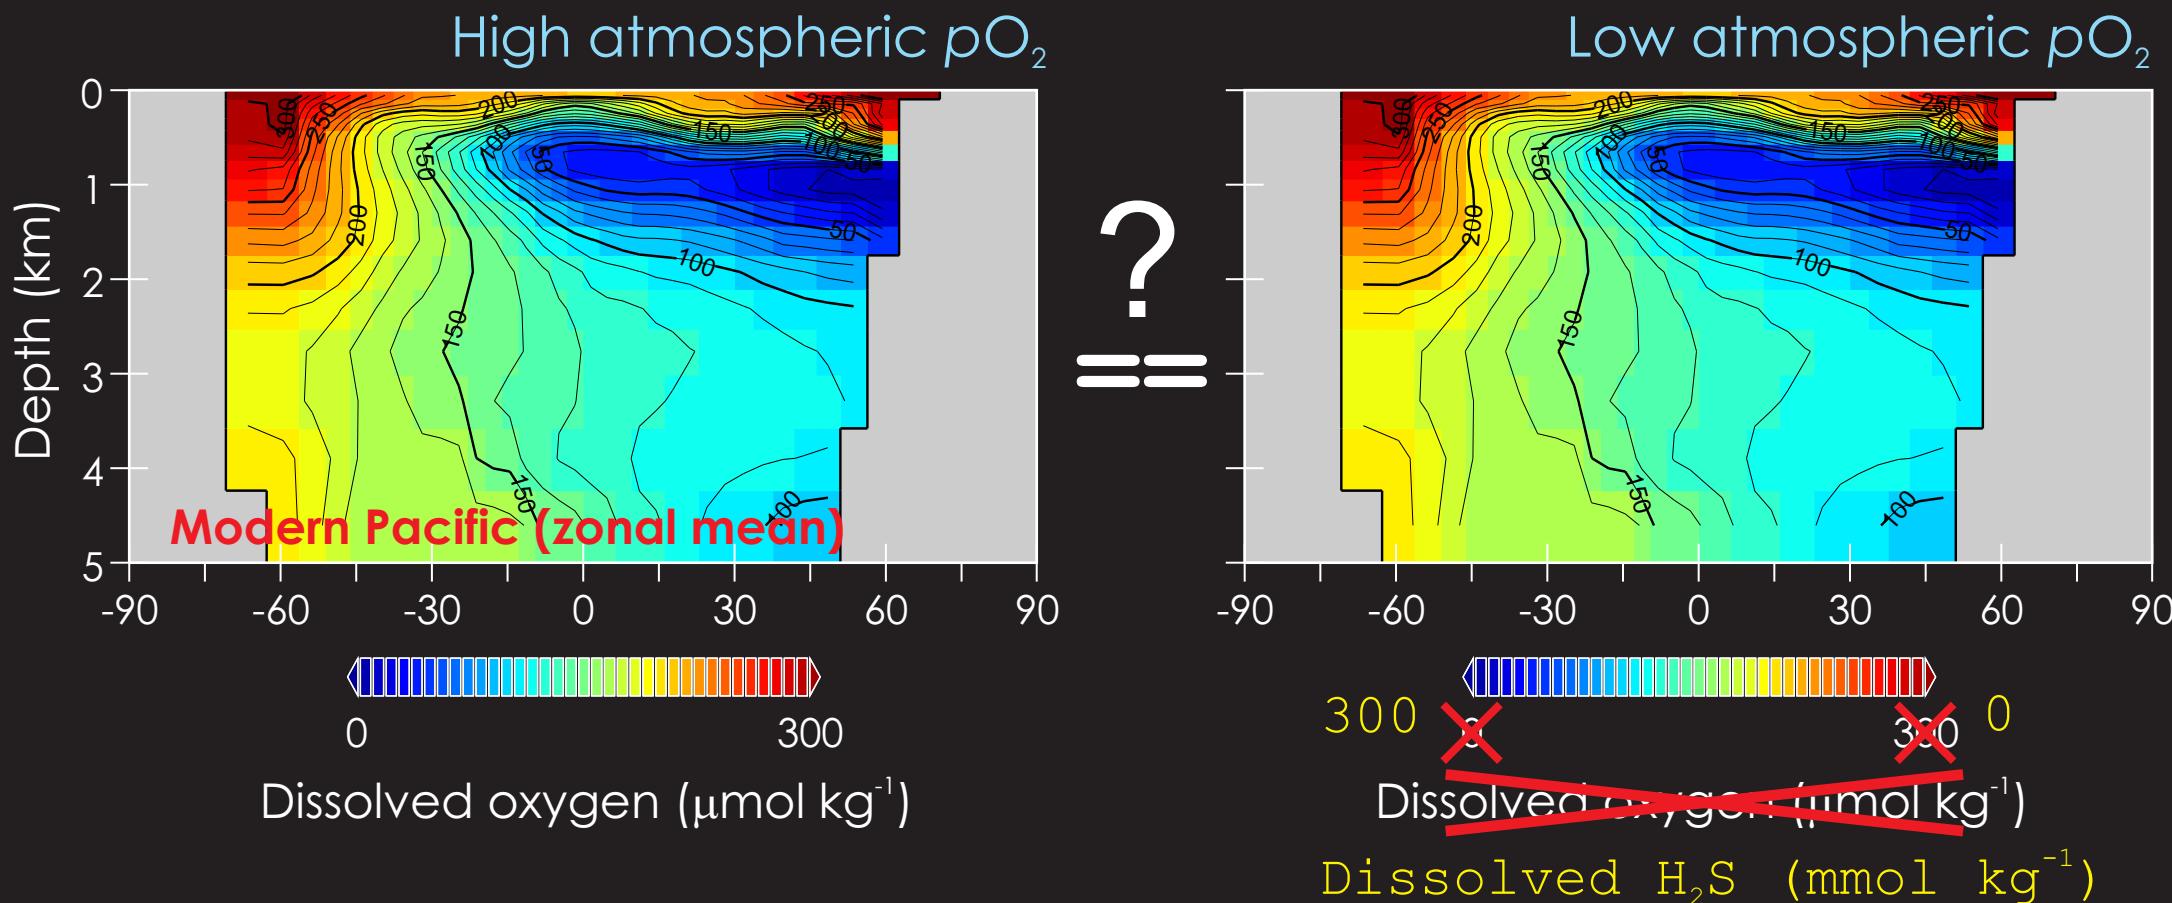

Evolution of the Biological Pump: The Role of Dissolved organic matter (DOM)?

In the Rothman et al. [2003] model, the RDOC reservoir is assumed to have been at least 10 times the size of the inorganic (ocean DIC + atmospheric pCO₂) reservoir. For a modern DIC + pCO₂ reservoir of 39,000 PgC, this mean 390,000 PgC of DOC – more than 500 times larger than modern). For a higher late Precambrian DIC reservoir, the minimum DOC reservoir becomes 1.6×10^6 PgC, equivalent to concentration of a little over 1000 mgC per L of seawater and becoming the third most dominant dissolved species in the ocean after Cl⁻.
